### Fruit Forcing.

**CUCUMBERS.**—Plants that have been in bearing some time can be invigorated by a top-dressing of turfy loam, to which has been added about a fifth of thoroughly decayed manure or sweetened horse droppings and about a tenth of "nut" charcoal. A sprinkling of superphosphate, with an equal amount of soot added to it and mixed, sprinkled on the surface, will promote root formation and sturdy growth, with good colour; also resistant power against disease. Afford copious supplies of water, but let the soil be getting dry before any is given, then supply enough to moisten the bed through, using it at the same temperature as the houses. Thin the exhausted growths and lay in young, by which means the plants will continue bearing for some time longer. The autumn fruiterers are in full crop. These must not be overburdened; therefore remove fruit as soon as it attains a fair useable size, and all deformed fruit when observed. Examine the plants at least once a week for the removal of bad leaves, stopping or cutting away superfluous growths, keeping the foliage fairly thin, yet an even spread on the trellis.

Winter fruiterers should be allowed to become well extended over the trellis before pinching them for the production of fruit, training the growths evenly, and not more closely than to allow of the foliage being exposed to light. Stop after that at a few joints of growth or one or two joints beyond the show of fruit, but if the plants are weak allow more extension, and crop lightly at first. Remove most male flowers, and do not allow tendrils, but remove them as fast as they appear. Keep the beds replenished with soil, adding fresh and warmed as often as the roots appear at the sides of the ridges or hillocks.

Maintain a night temperature of 65deg, 5deg less in the morning of cold nights, 70deg to 75deg by day artificially, advancing to 80deg and 90deg, or more with sun heat. Admit a little air at the top of the house whenever the weather is favourable, affording it, however, without lowering the temperature. Judicious ventilation, however, is highly beneficial in carrying off superfluous moisture and giving solidity to the growths, enabling the plants to tide over the trying ordeal of prolonged severe weather, when plants with thin textured leaves often succumb. The syringe will only be necessary for damping paths and walls in the morning and afternoon in bright weather, which will give rise to the needful moisture, especially when the evaporation troughs are charged with weak liquid manure or water. On bright afternoons a light bedewing of the plants overhead will be beneficial, but care must be taken to practise it early enough to allow of the foliage becoming dry before nightfall, and not make the foliage tender by its too frequent recurrence. All water used for damping, watering, or liquid manure applied to the roots must be of the same temperature as the house or bed.

**STRAWBERRIES IN POTS.**—All plants for early forcing should be in frames with a view to protect them from heavy rains, and render them available for being draughted to the forcing house whenever required. Those for midseason and late forcing are as well plunged in ashes in a sheltered situation as anywhere else, indeed better than in piles against walls or houses with constantly open ventilators, which form the currents of air, which drive the life out of them and favour attacks of aphides and red spider. When plunged outdoors the plants are cool, moist, and airy, all primary conditions for Strawberry plants, and a light covering of bracken or straw in severe weather will save the tenderest varieties from injury.

Plants of La Grosse Sucrée, Royal Sovereign, and Viscountess Hericart de Thury should be held in readiness for starting early in next month. Where Strawberries are required very early the good old practice of affording bottom heat has no equal in securing good results. A light, airy, well-heated pit, with a pathway up the centre and beds or pits on each side that will allow of about 3ft depth of tree leaves being placed in and brought up so that the plants are about 1ft from the glass, is the most suitable. Strong, healthy plants with well-matured crowns may be given a top-dressing of a mixture of two parts phosphate of potash and one part nitrate of ammonia, about a thimbleful to each pot mixed with ten parts good loam; the surface soil should be removed with a pointed piece of wood, and the top-dressing applied to the pot in place of that removed. When the warmth of the leaf-bed has reached 65deg the pots may be plunged therein, but care must be taken that the heat about the pots does not exceed 70deg at the base of the pots. If the soil of the pots is in a moderately moist condition no water will be required, but if dry—a bad thing for Strawberries—water must be supplied to render the ball evenly moistened through. After this, little or no water

Fig. 2.—Mr. Strugnell's Seedling Nectarine, No. 2.

C, fruit, natural size; f, light shaded part of fruit, pale yellow; g, portion of fruit, bright crimson in stains and streaks; h, white suture. D, leaf, two-thirds natural size; i, petiole with round glands; j, edges sharply serrated.

Lord Palmerston and Sea Eagle Peaches. 4. Tree on its own roots. 5. Stone planted in 1899.

No. 1 seedling resembles Hardwicke's Nectarine, though the fruit is smaller, but this would no doubt be considerably enhanced by working on the Plum stock, seedling trees not usually producing large fruit. The seedling, however, ripens a month later than Hardwicke's, or at the same time as Victoria, from which it differs in the higher colour of the fruit and in the leaves being glandless. Mr. Strugnell says there is "no tree of Hardwicke on the place," and the tree appears hardier than Victoria, hence the seedling is likely to prove an acquisition to late Nectarines.

No. 2 seedling, fig. 2, C and D, was sketched and tested on October 14, 1902. Fruit rather large, about as high as wide, terminating in a point at the apex, where is a black, minute nipple, from which issues a faint suture, which appears like a white hair-line towards the stalk. Skin, pale yellow or lemon, stained, streaked, and mottled with bright crimson at the apex or next the sun, and even with crimson shading on the shaded side of the fruit. Flesh, pale yellow, very tender and juicy, stained with red next the stone, from which it separates freely. Flowers large, glands round.

This is a very richly flavoured Nectarine, and resembles Humboldt, but ripens about a month later. Mr. Strugnell describes it as a chance seedling, whose origin is unknown. The tree is on its own roots, and is grown against a south wall. He says the seedling No. 2 resembles Pineapple in shape and colour of flowers. The tree dates from 1898, and this its first time of fruiting. Downton, Pineapple, and Victoria are the varieties of Nectarine grown at Rood Ashton for late, but young trees of Humboldt, Spenser, and Newton are in hand for late gathering in the future.

I may say that Mr. Strugnell also forwarded fruits of Humboldt, Pineapple, and Victoria for comparison, and from these the seedlings have distinct features.—G. ABBEY.

will be required until the flower trusses appear, as the moisture of the fermenting leaves will be communicated to the pots and keep the soil sufficiently moist. Air should be given at 55deg, and all the ventilation possible above that, closing at 55deg and maintaining a temperature of 50deg. This will be sufficient until the trusses of bloom are thrown up; when the plants are near coming into flower they should be gradually withdrawn from the fermenting bed and given a position not more distant from the glass than 1ft to the foliage, the temperature still being 50deg at night and 55deg in the daytime, advancing to 65deg from sun heat. The plants will need little or no syringing until the fruit is set, but the plants must be kept free from aphides by fumigating the house as required, so as to have the plants quite free from the pests by the time they come into flower. When the fruit is set and swelling the temperature may be raised to 60deg at night and that of the day to 65deg or 70deg, advancing 10deg to 75deg or more from sun heat, with free ventilation, but not cold currents of air driving on the fruit, as this would dry up and ruin the crop. —ST. ALBANS.

Hardy Fruit Garden.

FORMS OF FRUIT TREES.—Various forms of fruit trees should be selected when planting largely, so as to adapt the best form to the position and space at command. Even gardens of limited extent may be furnished interestingly and profitably with several forms of trees which can be grown in a restricted style.

STANDARDS.—For profit and simplicity of culture there is no form of tree which possesses better general merits than standards. They are well suited for large plantations where plenty of space is available. Standards should not be grown less than 20ft apart in the case of Apples and Pears. Plums, as a rule, are wide enough apart at 15ft. The chief merit of standards is that they may be allowed to develop free growth, extending their branches well on all sides in an equal manner. Efforts to curtail extension must not be attempted by shortening, though the growth may be equalised and balanced by removing any overgrown branches, and a system of thinning out should be practised whenever there appears to be crowding. The trees have usually clear stems to the height of about 6ft, and a limited number of well-regulated branches at the time of planting. If these are not sufficient, shorten them back to increase the number the next season. Half-standards are useful, especially in the case of Apples and Plums. They have much shorter stems. Then there are the standard trained, or riders, which have long stems with flat fan-trained heads. These are used for lofty walls and sides of buildings, and frequently employed to cover the upper face of a wall, while the permanent trees are growing below.

PYRAMIDS.—The pyramidal form of fruit tree is a useful, profitable, and convenient shape for both large and small gardens. The branches are produced from quite low down the stem, the lower ones being allowed to extend a good length, while those higher taper to the top. They all ought to be originated thinly, and the side shoots they produce kept spurred in. The trees are liable to grow too freely when established, especially if on free stocks. This tendency may be subdued by lifting and replanting, shortening strong roots. The closer the trees are grown, the oftener root-pruning will be necessary. If Apples are grown on Paradise and Pears on Quince stocks growth is less vigorous; hence the trees may be planted 3ft to 6ft apart.

BUSHES.—The term bush as applied to Apples means a tree which is, or will be, of considerable size. The branches may originate low down on the stem like pyramids, but, unlike them, they may have the branches extending to one more uniform length, forming round-headed trees. Bush Apples are best grown 9ft to 12ft apart on Crab stocks, Pears on Pear stocks the same. Apples on a dwarfing stock such as the broad-leaved Paradise, and Pears on the Quince, may be grown 6ft apart. Bushes are usually grown with a limited number of main branches, which ought not to be too thickly placed. The side shoots are summer pruned, and shortened to form spurs in winter. This form of tree when in good condition is always prolific. Bush also applies to low-growing fruit trees, such as Currants and Gooseberries. The management of these consists in judiciously arranging the growths so as not to unduly crowd, and be equally balanced.

CORDONS.—Cordon trees are among the simplest forms, and are profitable and free bearing if well managed in the planting and after-treatment. For planting in a diagonal form against walls and fences the single stemmed cordons are the best. When trained upright the single stems are the most suitable also, planting in both cases 18in apart. Gooseberries and Currants may be grown on walls with this form of tree. Single stemmed plants should be 6in apart, or a plant may be trained so as to have three stems, each 6in distant from the other. In this case plant 18in apart.

FAN-TRAINED.—Formal and restrictive training other than on the cordon system is not, as a rule, profitable for walls. With fan-trained examples there is a greater amount of freedom in growth, and the trees can be better and more profitably managed than on the strict formal lines which confine the growth to a few main branches, such as horizontal-trained trees possess. The

usual forms for walls are the dwarf-trained with short stems not more than 18in high, and the half-standard trained with 1½ft to 3ft stems. The branches radiate like a fan, and can be regulated annually, readily cutting out the least desirable, and training at the best distances apart the most fruitful. The temptation to overcrowd must be avoided from the first. Peaches, Nectarines, Apricots, Pears, Plums, and Cherries are all adapted for this method, and may be planted 15ft apart. All these usually do well without root-pruning, but Pears on free stocks require some root restriction if the growth is so free that fruiting is prevented. —E. D. S.

W.C. 1s., paper covers; full of interesting and amusing illustrations of pussy, with bright and readable stories; a fine booklet for the children. \* \* "The Pacific Fruit World," Harvest Review series; 1, Prunes and the Prune Harvest, October 18, 1902; Apples and the Nut Crops, October 25, 1902, from Los Angeles, San Francisco.

Reclamation of Waste Land.

As for the depopulation of the rural districts, writes a veteran farmer to a contemporary, I think one of the greatest causes is the want of more proprietors, and the allowing of so much good land to remain uncultivated. There is as much uncultivated land in this country as would give employment to thousands of labourers. I know I shall be told that it will not pay to break up and cultivate unreclaimed land, but if you would take a trip out to Biggar and see what the Messrs. Murray, of Spittal, have done for Biggar Moss and for Heaveyside you would see that I am right. A former tenant of Heaveyside told me that very often in wet weather he had to drag some of his cattle with ropes out of moss holes, and cart them home. Now, if you will pay a visit to Heaveyside you will there see a large dairy of good heavy cows, and I never heard of them having to drag a single cow out of a bog, and they have supplied part of Biggar all that time. If the land of this country had been more equally divided, we would not have been so much eaten up and pestered with rabbits and ground game as we are, for a great number of our landed proprietors are more set upon feeding and breeding game than of cultivating their land, and giving employment to the rural population. If you should think of coming out to see Biggar Moss and Heaveyside, and if you are not satisfied then with what you see, if you would go the length of Stonehill, Lesmahagow, you would there see a place which seventy years ago was producing nothing but heather and bent. There was not a house nor a dyke upon the place. The proprietors did not require to expend a single farthing upon it, and the place has been let for the last fifty years at £4 per acre, so I think it has paid the cultivating very well.

## TO CORRESPONDENTS

\* \* All correspondence relating to editorial matters should be directed to "THE EDITOR," 12, Mitre Court Chambers, Fleet Street, London, E.C. It is requested that no one will write privately to any of our correspondents, seeking information on matters discussed in this Journal, as doing so subjects them to unjustifiable trouble and expense.

**CINERARIAS WITH LEAVES ATTACKED (W. L. F.).**—The only means of destroying the grubs in the leaves is by pressing them between the thumb and fore-finger. You can see or feel where the grub is lying within the tissues.

**BOOKS WANTED (Idem).**—"Garden Manual," 1s. 9d.; "Royal Parks and Gardens of London," 2s. 6d.; "Vines and Vine Culture," 5s. 3d.; "Poultry for the Many," 7d.; or 9s. 11d. in all.

**LILY OF THE VALLEY (Ninga).**—It does no harm to water over the blooms when they are nearly or entirely expanded under forcing. Use the water tepid. If the overhead watering can be avoided, then by all means do so. If a hose is used, a jet or flange of water can be sent under the flowers to the roots. Mr. Jannock, of Dersingham, Norfolk, had it in his mind to write a pamphlet on Lily of the Valley culture, but whether he ever did so or not we are unable to say. No other booklet is devoted to a treatise on this plant alone.

**BOOK ON CHEMISTRY (C. C.).**—The book you have bought will be of some service to you; but there has just been published a second edition of the same work, of which you may have observed reviews in this journal. What we would advise is that you secure Cousins' "Chemistry of the Garden," 1s. net, from Macmillan and Co.; and probably also "The Chemistry of the Farm," 2s. 6d., by R. Warrington, and obtainable through booksellers from Vinton and Co., Limited. Read these closely, after which you will be a better judge as to what further books you require to continue the study.

**PIGEON MANURE FOR VINES (Anxious).**—We would secure and keep the pigeon manure perfectly dry by placing it in layers of 3in or 4in deep on shelves in a cool chamber or shed. If the dung is quite dry, and not likely to ferment, it could be placed in boxes or sacks. After the Vines have been cleaned and pruned, it could be used as a top-dressing for the borders by itself, in the same way that guano is employed, and at the rate of about 1lb per square yard of surface, this to be pointed in. You could assist the Vines during growth by alternately watering with Thomson's Vine manure, Clay's guano, and the pigeon manure each in a liquid state. Read closely the remarks under "Work for the Week."

**SHED BERRIES FROM ASPARAGUS (G. F. O. B.).**—The plants that have shed the berries mostly in the alleys will suffer from the progeny that must necessarily follow from the sowing of the seed, they also being prejudiced in the bearing in the coming season by being allowed to carry the berries this season, seed production being a great strain on the plants producing them, not nearly as good crowns and buds being formed as when the berries are stripped off whilst quite young. This is one of the great evils in Asparagus culture, the numerous and relatively small heads being a result of allowing seed production, combined with allowing a great number of shoots to remain on a plant. The seedlings, however, that will result from the seeding can easily be pulled up during moist weather, though it may be necessary in some cases to use a hand for it. The work will be more than that of removing the berries early, and the only advantage is that of leaving a seedling where there may be gaps in the bed or plantation.

**NAMES OF FRUITS.**—Correspondents whose queries are unanswered in the present issue are respectfully requested to consult the following number. (T. A.).—Keswick Codlin. (W. C. and S.).—1, Nelson's Codlin; 2, Queen Caroline; 3, Newton Wonder; 4, Sops in Wine.

**NAMES OF PLANTS.**—Correspondents whose queries are unanswered in the present issue are respectfully requested to consult the following number. (G. A.).—If you can supply typical specimens of your *Spiræas* we will endeavour to have them named. (F. N.).—1, *Adiantum Capillus-Veneris imbricatum*. (J. F.).—1, *Quercus pedunculata*; 2, *Q. cerris*; 3, *Bambusa japonica*; 4, *Gaultheria Shallon*; 5, *Rhus Cotinus*. (N. M.).—1, *Vanda Kimballiana*; 2, *Dendrobium formosum giganteum*; 3, *Phalenopsis amabilis*. (J.).—1, *Begonia Dregei*; 2, *B. sanguinea*.

## TRADE NOTES.

Messrs. Wm. Logan and Co., florists, bulb and seed merchants, High Road, Chiswick, W., have recently executed orders for parts of France, Ceylon and South Africa, these comprising seeds and bulbs.

### Culture of Vegetables.

Messrs. Toogood and Sons, of Southampton, have issued a booklet of over 140 pages (7in by 5in) on the "Culture of Vegetables," at the cost price of 3d. post free. Illustrations are included with the text.

### Harkness's Floral Guide.

This illustrated floral guide has just been published, and is excellently arranged. A coloured plate of four varieties of early flowering Chrysanthemums is included, and there are great numbers of woodcuts and other figures. Obtainable at the Grange Nurseries, Bedale, Yorks.

### An Extensive Catalogue.

The general nursery stock catalogue, issued by Messrs. Fisher, Son and Sibray, Limited, Royal Nurseries, Handsworth, near Sheffield, contains within its covers select and representative lists of the best in hardy trees, shrubs, Roses, fruits of all sorts, stove and greenhouse plants, &c., and is prepared in sections. The heights of trees and shrubs for use in ornamental or utilitarian plantations, and selection for different purposes, are here given, rendering it a most serviceable guide to those many gardeners who have not the opportunity to inspect the nursery stock for themselves.

## Trade Catalogues Received.

## Horse and Motor Power.

After a succession of dry seasons and stunted crops, we have been treated to the other extreme, and although personally we have not much to complain of, there is reason to believe that a great number of farmers will have little pleasure in looking back to the season of 1902. No doubt farmers of grass land have had a good year, with an excellent prospect for the near future, but the profit from arable culture is so meagre and uncertain that it is only by concentrated effort to keep the expenses of the farm down that a living profit can be realised at all.

A very large portion of the arable land of the country is let at 20s. per acre or less, and in many cases labour bill on those same farms exceeds three times that amount, and farmers should see that they are not wasting money in a lax manner on labour before going to their landlords for reduction of rent. In writing of labour we are not confining ourselves to manual labour. Expensive and difficult to obtain as hand labour is, it is for many purposes quite as cheap and more effectual than horse-power. The horses of the farm cost us much more than we think. In reckoning the expenses of keeping horses we are apt to allow too little for grass, Clover, hay, bedding, roots, &c. These all come off the farm, and as they are not to pay for we do not bring them into the balance sheet. But all the food consumed by horses is of as much value when consumed by them as it would be if devoted to feeding cattle, sheep, or pigs. In fact it should be charged at a higher rate, because the manurial residue is of less value from horses than it is from cattle or sheep.

When a labourer has finished work he goes home and feeds himself. The horse has to be taken home, fed, and tended, both late and early, and there is great and increasing difficulty in getting this necessary work done punctually and in a proper manner. With the great educational progress that we are promised, it is most unlikely that village lads will much longer consent to rise at 4 a.m., feed the horses and themselves, and be at work ploughing soon after six, and this difficulty will lead to the partial disuse of horses on the land. Already we hear of experiments being made in motor traction. Successful trials have been made not only in drawing reapers in the harvest field but in ploughing and cultivating stubbles, and it seems quite within the bounds of probability that motors may become regular parts of the farm machinery. If, as is claimed, the cost for fuel be only 1d. per horse power per hour, there can be no doubt that they will prove cheaper to use than horses, for 1d. per hour for a nine hours' day would amount to no more than 4s. 6d. per week, which is not half the cost of a horse.

There is another point: The horse eats every day,

whether working or not. The motor only burns fuel when wanted. Their capabilities to do farm work may be limited for a time until by experiment and improvement they are adapted to land work and farm requirements, but that oil engines will be so adapted seems to be a moral certainty.

It is surprising that steam traction has not been more used in delivering grain, especially during the autumn, when so much corn is marketed, and there is always plenty of work for the farm horses without any waggoning. On a large farm a traction engine might be constantly employed in threshing, cutting, grinding, &c., apart from any possibilities of work on the lands.

At first motor power must be limited to work on farm land, and they can hardly be adapted to work amongst Potato and Turnip ridges, but man's power of inventiveness is so wide that it would be unwise to speak too positively as to that. What is needed for farm work is an engine which can move freely on the land and drag a good-sized cultivator with ease. Three and four furrow ploughs will be used, according to the class of work needed. By the use of roomy deep-sided rullies an engine might do all the Mangold and Turnip carting, besides delivering all the corn and Potatoes. There are many farms in the country which grow as many Potatoes as would keep a traction engine employed during the great part of the winter.

What are the Americans doing in this matter? Information on that point would be valuable. They generally lead the van in economic progress, and they have the necessary fuel in the shape of petroleum. The substitution of the engine for the horse would remove one of the interesting features of country life, but we do not suggest that the horse will be banished altogether, and admirers of the animal need not fear that such will be the case, but we do think that he will lose to a great extent the prominent position he now occupies. Some people will raise objections to the discarding of horse power because it would have a tendency to restrict the demand for Oats and other forms of horse corn, and the farmer would lose as much as he would gain. Well! cycles and motor cars have not prevented Oats reaching a high price during the past year, and we fancy that a foreign product called Maize is more in use amongst farm horses than any form of home produce.

## Work on the Home Farm.

Another grand week, almost summer-like, and we hope our belated friends have finished harvest at last. For ourselves we have been laying the foundation of another by getting our Wheat in, and if the finish is as good as the start we shall be fortunate.

We are pulling and storing Mangolds now, and find them smaller than last year. The heap will certainly be a less one, but, fortunately, other roots are plentiful. We shall pie a good lot of Swedes after Martinmas. The weather prophets are promising us a severe winter, not that we have the slightest faith in their knowledge, but Swedes are big this year, and stand well out of the ground, so are more liable to frost injury than usual.

Those we store for cattle use we shall top as we do the Mangolds. Those for sheep food will be pulled up and thrown into heaps, tops and all, and then covered with soil. Good Potatoes are now making 60s. on rails, and fair quantities are being moved. There is an idea amongst growers that the tuber is going to reach a high price. We do not agree with them, and fancy the crop will prove ample for all requirements. There is very little disease, and 60s. for immediate delivery is a handy price.

On mixed farms the cattle should be all in the yards, or at any rate receiving good rations of dry food.

We saw a number of beasts the other day on a bare pasture; there were no troughs or tumbrils visible, and they looked very thin and empty. There is no economy in starving meat-producing animals. The most successful farmers are those who keep all their stock in good condition. It is the same with all farm animals. Pork keeps very dear, and never did pigs pay better for good food. At 6d. and 6½d. per lb. there is excellent profit on the value of pig food, and as we said last week, sound food is better than offals.

Of course on a farm there is a good deal of tail corn to consume by pigs or poultry, but when the corn or meal is poor in quality an extra allowance should be given. If farmers fed their poultry better they would get a vast increase of eggs. As a rule the master takes no practical interest in the egg basket, and in many cases when he does it is an antagonistic one. The feeding is too often left in undesirable hands, and the corn which is debited to the poultry finds its way to other mouths. Cart horses get a good deal of hen corn, the hens lay badly, the mistress grumbles, and the master says poultry keeping is unprofitable. But whose fault is it?

# ROSES.

**OUR  
CORONATION  
YEAR  
SUCCESSES:**

**We Won . .**

The Champion Cup of the  
National Rose Society,  
value 50 guineas.

(For the fifth time.)

The Gunnersbury Park  
Challenge Cup, value  
25 guineas.

Two Coronation Rose  
Show Cups at the  
Holland House Show.

Four Gold Medals.

Two for our New Rose  
"Lady Roberts."

## CLIBRANS

## CHOICE FRUITS

**New or Recent Varieties.**

WE append a list of a few choice varieties of various classes of fruit. We make a feature of high-class fruit, and are in an unique position to supply trees and plants of the highest excellence.

### NEW APPLE, "Rival."

**Award of Merit, R.H.S., Oct. 9th, 1900.**

The outcome of a cross between Peasgood Nonsuch and Cox's Orange Pippin. A superb variety equally good for dessert or culinary use. A good grower, and free bearer. Experts and the Press are unanimous upon its merits. Maidens, 2/6 each; Two Year Trees, 5/- each.

### NEW APPLE, "Charles Ross."

**First-Class Certificate, R.H.S., Oct. 10th, 1899**

A grand new dessert variety. The fruits are of large size and of handsome appearance. The flesh is rich and of a delicious flavour. This variety is undoubtedly destined to take a high position among dessert fruits. Maidens, 3/6 and 5/- each; Two Year Trees, 15/- each.

### NEW PEAR, "Charles Ernest."

**Award of Merit, R.H.S., Dec. 4th, 1900.**

For late use, this variety will prove to be a welcome addition. The fruits are of large size, pyriform in shape, with a yellow skin; flesh very juicy and melting. Maidens, 1/6 each.

### NEW PEAR, "Winter Orange."

**Award of Merit, R.H.S., March, 1899.**

Without doubt this is a splendid variety for stewing purposes. The fruits are of large size, and remain in good condition until April or May. The fruits possess a delicious flavour, and are produced in great abundance. Maidens, 1/6 each.

### NEW DESSERT CHERRY, "Noble."

**First-Class Certificate, R.H.S., July 25th, 1899**

Fruits large, firm, deep blood red in colour, delicious flavour; produced in the greatest abundance. The tree is of strong and vigorous constitution, and pronounced to be the finest variety introduced during recent years. Dwarf Maidens, 3/6 each.

### NEW GOOSEBERRY, "Victoria."

A splendid new variety, of strong and vigorous constitution; a most prolific bearer, the branches being literally packed with fruit of excellent flavour. The fruits ripen about seven days earlier than do those of "Whinham's Industry." Strong Fruiting Plants, 1/- each; 10/- per doz.

### NEW GOOSEBERRY, "Howard's Lancer."

**Award of Merit, R.H.S., August 13th, 1901.**

A variety of great promise. The fruits are of large size, and of pleasant flavour. An immense cropper. Equally good for early or late use. Price, Strong Two Year Bushes, 3/- per doz.

**For New Varieties of**

**BLACKBERRIES, STRAWBERRIES,  
RASPBERRIES, GRAPE VINES,  
and all other Fruits, see our**

MANCHESTER.**

*Journal of Horticulture.*

THURSDAY, NOVEMBER 20, 1902.

## Rose Analysis, 1895-1902.

IN my last Rose Analysis, which appeared in the *Journal of Horticulture* on October 31st, 1901, will be found an explanation, should this be desired, of the method adopted in the compilation of these analyses, of which the present one is the seventeenth of the series. In any case it may be well to explain that the positions of the different varieties in the accompanying tables are dependent upon the average number of times they were staged in the first, second, and third prize stands at the last eight metropolitan exhibitions of the National Rose Society. That is to say, the full eight years' average is given in the great majority of cases, but where the varieties have not been out a sufficient time to allow of this being done the longest trustworthy average is given them instead. The necessity of a fairly long average will be understood when it is considered how the results must from year to year be affected by early and late seasons.

Take, for instance, the past Rose season as an extreme example. The cold weather in May and the first three weeks in June caused the growth of Rose plants to be exceptionally backward this year. Indeed, as late as Midsummer Day fears were entertained that there would be but very few Roses in bloom even in the south of England on July 2nd, the date fixed for the National Rose Society's Exhibition in the Temple Gardens. Fortunately a change to warmer conditions took place about ten days before the exhibition, and lasted until the show day, with the result that after all most of the classes in the schedule were well filled and a most enjoyable and interesting exhibition was held. The effect, however, of the previous cold spell will be clearly traceable in

READERS are requested to send notices of Gardening Appointments or Notes of Horticultural Interest, intimations of Meetings, Queries, and all Articles for Publication, officially to "THE EDITOR," at 12, Mitre Court Chambers, Fleet Street, London, E.C., and to no other person and to no other address.

the present analysis if the figures given in the third column in the tables be compared with those in the second column. It will then be noticed that while the early-flowering varieties were mostly shown at the last exhibition in unusual numbers, those which flower later in the season were, as a rule, but sparsely represented.

For the first time for ten years that grand variety Mrs.

John Laing no longer heads the list of Hybrid Perpetuals and Hybrid Teas, its place having been taken, as I suggested last year was probable, by Bessie Brown, a Hybrid Tea of recent introduction. The late season may no doubt have favoured to some extent the latter variety, but then on the other hand it must be borne in mind how heavily handicapped Bessie Brown must have been by its youth—having

\* New varieties, whose positions are dependent on their records for the 1902 show only.

been sent out only three years ago, whereas Mrs. John Laing has been largely grown by exhibitors since 1890. It is very gratifying to be able to state that both of these varieties were raised in the British Isles. For exhibition purposes the beautiful creamy white blooms of Bessie Brown may of the two be finer and more certain, but we must never forget the sterling virtues of that recently dethroned queen, Mrs. John Laing. For after all there is still no other Rose in its class possessing so many fine qualities, particularly if its merits on the exhibition table and in the garden be taken together. Curiously enough, four out of the leading six varieties in the table are pink Roses—Mrs. John Laing (No. 2), Caroline Testout (No. 3), Mrs. W. J. Grant (No. 5), and Mrs. R. G. Sharman Crawford (No. 6). Then a little lower down we come to La France (No. 10) and Her Majesty (No. 11), making six pink varieties in the first twelve.

The following established kinds, Caroline Testout, Mrs. W. J. Grant, Marquise Litta, Kaiserin Augusta Victoria, and White Lady have never before been as frequently staged as they were at this year's exhibition; while La France has the best record for ten years. It will be noticed, as has been before pointed out, how greatly the late season favoured the early flowering varieties. On the other hand, those Roses which as a rule flower late or in the middle of the season, were at that show placed at a great disadvantage. For instance, Gustave Piganeau, Alfred Colomb, Marie Baumann and Marchioness of Londonderry have never before, and Mrs. John Laing, Ulrich Brunner, Her Majesty, S. M. Rodocanachi and Dupuy Jamain have only once before been as poorly represented. A. K. Williams, which is generally regarded as an early Rose, was this year, strange to relate, to be seen in fewer stands than at any previous exhibition.

There are seven of the newer Roses on the list—varieties which are five or fewer years old. Of these, the rosy carmine Countess of Caledon, which was sent out in 1897, has only slightly improved on the position it occupied in the previous analysis. The delightful pale pink Killarney (No. 29), which

was distributed in 1898, rises four places. Of the four 1899 varieties Bessie Brown, as before stated, occupies, for the first time, the premier position on the list—a remarkable feat for so young a Rose. Ulster (No. 25), which is salmon-pink in colour, rises three places, and Mrs. Cocker, another pale pink variety, not before a candidate for honours in these tables, will be found at No. 46. Papa Lambert, salmon-rose in colour, on its first appearance in the list, takes a place at No. 60. The beautiful ivory-white Mildred Grant, although only sent out last year, secures a position at No. 46. If we may judge from the splendid form in which it was exhibited in some of the stands at the Temple Rose Show in July last, this variety is certain shortly to occupy a very prominent place in the table. Its great size, good form, and the depth and substance of its petals, at once mark it as a grand exhibition variety. All these new Roses are of British origin except one. The five leading sorts, Bessie Brown, Ulster, Killarney, Countess of Caledon, and Mildred Grant were raised by Messrs. A. Dickson and Sons, of Newtownards, Ireland; the next on the list, Mrs. Cocker, by Messrs. J. Cocker and Sons, Aberdeen, and the foreign variety, Papa Lambert, by P. Lambert, of Trier, in Germany.

The progress that is being made by the Hybrid Teas is even more pronounced than last year. There are now fourteen instead of ten Roses in the table, while six of them are among the ten varieties with the highest records—to say nothing of a Hybrid Tea for the first time capturing the premier place. Among the coming candidates for fame may be mentioned four very promising Hybrid Teas now being sent out by Messrs. A. Dickson and Sons, viz., Alice Lindsell, creamy white; Duchess of Portland, after the style and colour of Kaiserin Augusta Victoria; Edith D'Ombra, white; and Lady Moyra Beauclerc, a very distinct shade of rose colour.

In my last analysis I stated that as regards the Hybrid Perpetuals the advances made were by no means as encouraging. This is, however, no longer quite as true as it was then, for there are two new varieties of sterling merit in that section which are likely to be very largely grown and exhibited

| 30                            | 6.7                            | 4  | Francisca Krüger .....         | 1879                  | Nabonnand .....                | Coppery yellow, shaded peach    |
| 31                            | 6.4                            | 7  | Madame Bravy .....             | 1848                  | Guillot .....                  | White, flushed pink             |
| 32                            | 5.1                            | 6  | Etoile de Lyon.....            | 1881                  | Guillot .....                  | Deep lemon                      |

\* A new variety, whose position is dependent on its record for the 1902 show only.

during the coming year. I refer to Bent Cant and Frau Karl Druschki. The former will be a most welcome addition to the dark crimson H.P.'s, as it is a good grower and the flowers well shaped, with high pointed centres. Its great charm, to my mind, consists in its stout clean cut petals—most desirable qualities in any exhibition Rose. This fine variety was raised by Messrs. B. R. Cant and Sons, of Colchester. Frau Karl Druschki appears to me a splendid acquisition. For years the great want among the H.P.'s has been a really good pure white variety, and in our anxiety to secure this treasure we have hitherto been content to welcome any sort which appeared to supply this long felt want, but all have proved more or less disappointing—falling short in one way or another of what a really high-class white Hybrid Perpetual ought to be. If I may judge from the plants of Frau Karl Druschki I saw recently in the Colchester Nurseries, the Rose required has at last made its appearance. It is not only a pure white Hybrid Perpetual, but appears to possess besides more good qualities than fall to the lot of most of the choicest varieties in that section. Its growth is all that could be desired, while the flowers are large, deep and well-formed, with petals of good substance. It is, moreover, a true perpetual, in fact, at the time of my visit, October 14, I did not notice any other Rose which was flowering as well or so freely.

#### Teas and Noisettes.

Coming now to the table of Teas and Noisettes, it will be observed that Maman Cochet again heads the list with its lemon-white sport, White Maman Cochet taking second place, the very positions Catherine Mermet and The Bride had previous to last year so long held. The leading flower, Maman Cochet, was not shown in quite as many stands as at the Temple Rose Show in 1901; but, nevertheless, has again a higher record than any other Rose whatever in the show. White Maman Cochet too, has well maintained its position, taking as it does the fourth place among the highest records even when both tables are taken together. Madame Cusin and Cleopatra have only once before been as frequently staged as they were this year, while Souvenir d'Elise Vardon and Medea were also unusually well represented. On the other hand, The Bride, Innocente Pirola, Muriel Grahame, and Ernest Metz, since they first came into general cultivation, have never before, and Madame de Watteville only once before, been as sparsely exhibited.

There are still only three new Teas on the list—those which are six or less years old. Fortunately all three are valuable additions to this section and occupy good positions in the table. Muriel Grahame (No. 13), the pale cream sport from Catherine Mermet sent out in 1896, on account of its poor record this year, does not occupy quite as good a position as in the last analysis. White Maman Cochet, an 1897 variety, has already been referred to. Mrs. Edward Mawley, distributed in 1899, owing no doubt in some measure to its early flowering habit, was this year very largely exhibited, and has consequently risen from No. 15 to No. 5. There are two new Teas which are certain to be added to the list another year. I refer to Lady Roberts and Souvenir de Pierre Notting. The former is a most charming apricot-yellow sport of Anna Olivier, which is being sent out for the first time this autumn by Messrs. Frank Cant and Co., of Colchester. The colour of this Rose alone must ensure its becoming a general favourite. Souvenir de Pierre Notting was raised by Soupert et Notting, and if large enough, its beautiful coppery-yellow blooms will be a welcome addition to any stand.

#### Garden Roses.

As will have been gathered from the preceding remarks, very satisfactory progress is being made in Roses of the exhibition type, but it is as nothing compared with the present inrush of "Garden" or decorative Roses. By "Garden" Roses is meant those varieties which are either not sufficiently large or not sufficiently full and perfect in form to allow of the individual blooms being set up separately like the Roses with which we have previously been dealing. Unlike the so-called exhibition varieties, this class of Rose is staged at the shows in large bunches. So popular a feature have these exhibits of "Garden" Roses become, that no Rose show would be considered in the present day complete without them. In the following table the varieties are arranged according to the total number of times they were staged in the prizewinning stands at the last three metro-

politan exhibitions of the National Rose Society, and no Rose has been included which has not been exhibited at one or other of those shows three or more times.

#### Garden and Decorative Roses.

| Position in analysis. | Name.  | Total No. of times staged in the three years. | No. of times staged in 1900. | No. of times staged in 1901. | No. of times staged in 1902. |
|-----------------------|--|---|------------------------------|------------------------------|------------------------------|
| 1                     | Gustave Regis (H.T.) . . . . .                   | 29  | 11                           | 11                           | 7                            |
| 1                     | William Allen Richardson (N.)                    | 29  | 7                            | 10                           | 12                           |
| 3                     | Marquise de Salisbury (H.T.)                     | 26  | 9                            | 9                            | 8                            |
| 4                     | Madame Pernet Ducher (H.T.)                      | 24  | 8                            | 8                            | 8                            |
| 5                     | Rosa macrantha (S.) . . . . .                    | 21  | 8                            | 8                            | 5                            |
| 6                     | Camœns (H.T.) . . . . .                          | 19  | 6                            | 7                            | 6                            |
| 6                     | Madame Chédane Guinois-seau (T.) . . . . .       | 19  | 7                            | 6                            | 6                            |
| 6                     | Reine Olga de Wurtemberg (H.T.) . . . . .        | 19  | 6                            | 4                            | 9                            |
| 9                     | Turner's Crimson Rambler (Cl. Poly.) . . . . .   | 18  | 4                            | 10                           | 4                            |
| 10                    | Paul's Carmine Pillar (S.) ..                    | 17  | 4                            | 5                            | 8                            |
| 11                    | Bardou Job (H.T.) . . . . .                      | 15  | 6                            | 6                            | 3                            |
| 11                    | Souvenir de Catherine Guillot (T.) . . . . .     | 15  | 3                            | 7                            | 5                            |
| 13                    | Claire Jacquier (Cl. Poly.) ..                   | 13  | 4                            | 4                            | 5                            |
| 13                    | Madame Falcot (T.) . . . . .                     | 13  | 5                            | 5                            | 3                            |
| 13                    | Papillon (T.) . . . . .                          | 13  | 2                            | 5                            | 6                            |
| 16                    | Alister Stella Gray (N.) ....                    | 12  | 4                            | 7                            | 1                            |

| 23                    | Lady Penzance (Sweet Briar)                      | 9   | 3                            | 1                            | 5                            |
| 23                    | Madame Anna Marie de Montravel (Poly.) . . . . . | 9   | 4                            | 2                            | 3                            |
| 23                    | Mignonette (Poly.) . . . . .                     | 9   | 4                            | 3                            | 2                            |
| 23                    | Paul's Single White (S.) ....                    | 9   | 3                            | 4                            | 2                            |
| 23                    | Perle d'Or (Poly.) . . . . .                     | 9   | 4                            | 2                            | 3                            |
| 23                    | Rosa moschata alba (S.) ....                     | 9   | 3                            | 3                            | 0                            |
| 23                    | The Garland (H.C.) . . . . .                     | 9   | 3                            | 6                            | 0                            |
| 32                    | Laurette Messimy (C.) . . . . .                  | 8   | 5                            | 2                            | 1                            |
| 32                    | Meg Merrilies (Sweet Briar)                      | 8   | 4                            | 1                            | 3                            |
| 34                    | Blanc Double de Coubert (Jap.)                   | 7   | 1                            | 2                            | 4                            |
| 34                    | Brenda (Sweet Briar) . . . . .                   | 7   | 5                            | 0                            | 2                            |
| 34                    | Cecile Brunner (Poly.) . . . . .                 | 7   | 2                            | 2                            | 3                            |
| 34                    | Madame Pierre Cochet (T.) ..                     | 7   | 1                            | 4                            | 2                            |
| 34                    | Red Damask (Damask) . . . .                      | 7   | 3                            | 2                            | 2                            |
| 39                    | Rosa Andersoni (S.) . . . . .                    | 6   | 3                            | 1                            | 2                            |

In addition to the above, the following established varieties were each staged in four prize stands at the last Temple Rose Show, viz:—Rosa multiflora (S.), Mme. Eugène Resal (C.), and Janet's Pride (Sweet Briar). Then among the newer Roses may be mentioned Purity (H.B.), which appeared in six prize stands, Leuchstern (Cl. Poly.) in five prize stands, Thalia (Cl. Poly.), Aglaia (Cl. Poly.), Leonie Lamesch (Poly.), and Irish Glory (S.) in four prize stands, and Euphrosyne (Cl. Poly.), Dawn (H.T.), and Paul's Royal Scarlet in three prize stands.

The introduction of a new class in the schedule this year in which summer-flowering Roses were alone admissible has been of much service, as it has brought to light a good many of the old-fashioned garden Roses, some of which are now very seldom seen. Of these I append a short list:

Blairi No. 2 (H.B.), Celestial (Alba), Commandant Beaurepaire (Gallica), Crested Moss (Moss), Coupe d'Hébé (H.N.), De Meaux (Provence), Double Yellow (Scotch), Flora (Evergreen), Hebe's Lip (Sweet Briar), Juno (H.C.), Ma Surprise (Microphylla), Madame D'Arblay (Musk), Madame Plantier (H.B.), Old Black Moss (Moss), Prolific (Moss), Red Damask (Damask), Rosa Mundi (Gallica), Rosa moschata alba (S.), Rosa Multiflora (S.), Tuscany (Gallica).

My thanks are due to those kind friends who again assisted me in taking down the names of the different Roses in the prize stands at this year's exhibition.

## Roses for General Cultivation.

The following lists have been drawn up with much care with a view to assist those who have but little knowledge of the different kinds of Roses, in making a selection for their own garden. All the established varieties are arranged under the various colours according to their order of merit, so that however small the number of Roses required may be, a satisfactory choice can readily be made. The varieties marked with an asterisk are either quite new or of recent introduction.

## EXHIBITION ROSES WHICH ARE ALSO GOOD GARDEN ROSES.

**HYBRID PERPETUALS.**—*White*: Frau Karl Druschki.\* *Pink*: Mrs. John Laing, Mrs. R. G. Sharman-Crawford. *Crimson*: Ulrich Brunner, Fisher Holmes, Alfred Colomb, Captain Hayward. *Rose*: Suzanne M. Rodocanachi. *Dark Crimson*: Prince Arthur, Prince C. de Rohan, Charles Lefebvre, Ben Cant.\* **HYBRID TEAS.**—*White and Cream*: Kaiserin Augusta Victoria, Mildred Grant.\* *Pink*: La France, Caroline Testout. *Carminé Rose*: Marquise Litta. **TEAS.**—*White*: White Maman Cochet, Souvenir de S. A. Prince. *Pink*: Maman Cochet, Souvenir d'un Ami, Mrs. E. Mawley.\* *Yellow*: Marie Van Houtte, Madame Hoste, Lady Roberts.\*

## GARDEN OR DECORATIVE ROSES.

**SUMMER-FLOWERING.**—**PROVENCE.**—*Pink*: Common. Moss.—*Pink*: Common. *White*: Blanche Moreau. **DAMASK.**—*Striped*: Rosa Mundi. **AUSTRIAN BRIAR.**—*Coppery-red*: Austrian Copper. *Yellow*: Austrian Yellow, Harrisoni. **HYBRID SWEET BRIARS.**—*Coppery Yellow*: Lady Penzance. *White, tipped crimson*: Janet's Pride. *Crimson*: Jeannie Deans. **CLIMBING ROSES.**—*White*: Bennett's Seedling (Ayrshire), Rosa moschata Himalayica (single). *Blush*: The Garland (Hybrid China). *Crimson*: Crimson Rambler (Cl. Polyantha). *Carminé*: Carminé Pillar (single). *Yellow*: Claire Jacquier (Cl. Polyantha).

**AUTUMN-FLOWERING.**—**HYBRID TEAS.**—*White*: Souvenir du Président Carnot, L'Innocence.\* *Blush*: Viscountess Folkestone, Madame A. Guinoisseau, Clara Watson. *Pink*: Killarney,\* Madame A. Chatenay, Camoens. *Rose*: Madame Jules Grolez, Grand Duc A. de Luxembourg. *Crimson*: Grüss an Teplitz, Liberty,\* Bardou Job (semi-double). *Yellow*: Gustave Regis, Madame Ravary.\* **TEAS.**—*Blush*: Dr. Grill, G. Nabonnand. *Pink*: Madame Lambard. *Coppery red*: L'Idéal, Beauté Inconstante, Madame Louis Poncet.\* **BOURBON.**—*Blush*: Souvenir de la Malmaison. **CHINA.**—*White*: Mrs. Bosanquet. *Pink*: Common, Laurette Messimy, Madame E. Resal. *Crimson*: Fabvier. **PERPETUAL SCOTCH.**—*Blush*: Stanwell Perpetual. **POLYANTHA.**—*White*: Madame A. M. de Montravel. *Flesh*: Marie Pavie. *Rose*: Gloire des Polyantha. *Crimson*: Perle des Rouges.\* *Yellow*: Perle d'Or, Eugénie Lamesch.\* **RUGOSA.**—*White*: Blanc Double de Coubert. *Blush*: Fimbriata. *Crimson*: Atropurpurea.\* **CLIMBING ROSES.**—*White*: Madame A. Carrière (H.N.), Aimée Vibert (N.). *Crimson*: Longworth Rambler (H.T.), Reine Olga de Wurtemberg (H.T.), François Crousse\* (T.). *Yellow*: Gloire de Dijon (T.), W. A. Richardson (N.), Alister Stella Gray (N.), Rêve d'Or (N.). **TRAILING ROSES.**—**WICHURIANA.**—*White*: Wichuriana. *Pale Yellow*: Jersey Beauty,\* Alberic Barbier.\* —E. M., Berkhamsted.

## Succession Fig Houses.

Prune and cleanse the trees without delay as soon as the leaves are all down, as this gives no vantage to insects, but, to a great extent, prevents red spider hibernating, and scale now removed stands a chance of the eggs not being produced or of not hatching. Complete any root-pruning or lifting, this being the only sure means of inducing fruitfulness in exuberant trees, combined with restricting the rooting area and a firm soil composed of calcareous material. Trees so treated are more manageable than with an unlimited root space, especially of rich and loose components. Any unfruitful trees should be severely root-pruned, cutting away a corresponding portion of strong, bare, unbranched limbs, leaving sufficient young and promising for covering the trellis, and restrict the roots to moderate-sized borders of firm calcareous materials, and feed from the surfaces, encouraging active feeders there by judicious light mulchings of sweet, rather lumpy, partially decayed manure, which should be added to from time to time during active growth, so as to keep an even mulch of about 1 in in thickness. Sprinklings of chemical manures, especially superphosphates, powdered saltpetre, and ground gypsum will sustain the trees in health and aid development and perfection of almost any amount of crop.—GROWER.

## Chrysanthemum, S. T. Wright.

In conversation with Mr. W. Wells, of Earlswood, who is sending out this splendid new Japanese variety, he recommended that it be treated like Mrs. Barkley; "and," said he, "let it have the sun." Second crown-buds were further commended.

## National Chrysanthemum Society, Floral Committee, Nov. 17.

A few novelties were submitted on this occasion, fewer than has hitherto been customary at this period of the year. First class certificates were awarded to

*George Mileham.*—A large and brilliant reflexing Jap of a bright ruby crimson colour, the long drooping florets, which have a silvery reverse, curling at the points. From Mr. Geo. Mileham, Emlyn House Gardens, Leatherhead.

*Incurved Madge Creagh.*—The surface colour is suffused with pale amaranth, but is hidden by the bright deep yellow reverse of the florets. A neat, compact, and well-formed flower. From Mr. W. Seward, The Firs, Hanwell.

A commendation was given to Ethel Cobb, a handsome, compact, reflexed flower, white with a yellow centre, from Mr. Albert Cobb, The Gardens, Hoodend, Hayes, Middlesex, who also exhibited a large bright yellow reflexed variety named Clara Priest, but too large to be included in the section.

Some pretty single varieties came from Mr. G. W. Forbes, Regent House, Surbiton; they were of the Mary Anderson type, and a commendation was given to a bright yellow, large-flowered variety named Lillias Jones. Ophir, deep pink, bright and pretty, and James Walton, ruby crimson, were the next best.

Market Crimson, a pale ruby crimson, medium-sized Jap, came from Mr. Geo. Carpenter, Byfleet, and was sent as a market variety. Mr. H. Weeks, Thrumpton Hall, Derby, sent J. Martin, of which a dozen blooms were shown. Colour, reddish terra cotta with a golden amber reverse, too small as shown to rank as an exhibition variety.

Japanese Mrs. Dugate, pink suffused with lilac, paler at the base; Jap Rose Holbrook, amaranth, with silvery reverse, a flower of the Australie type; and market Jap Elthorne Gene, a bright, deep reflexed yellow, came from Mr. Wm. Seward. Of the last-named the committee desired to see a plant.

## Groups at the Drill Hall.

Messrs. W. Wells and Co., Limited, Earlswood, Redhill, Surrey, contributed a spacious display of cut Chrysanthemum flowers at Tuesday's meeting of the R.H.S., a selection of select singles being arranged at the back and exhibition Japs in front. A number of meritorious unnamed seedlings were included, but among named varieties there were Miss Mary Anderson, a favourite single; Emily Wells, a rich purplish-mauve; Market Red, a rich deep crimson; and Dora, a tea-coloured single.

The best front flowers were Leila Filkins, a rounded Jap of a silvery-lilac colour, petals reflexing, very smooth, and plenteous (A.M.); Madame Paolo Radaelli, Lord Ludlow, Ben Wells (good), F. S. Vallis, General Hutton (enormous and beautiful rich yellow flowers), Mrs. T. W. Pockett, W. R. Church, Ethel Fitzroy (orange-apricot centre), Mrs. E. Fulton (incurving white), Nellie Pockett, and, lastly, Mrs. E. Shirkell, of the Mrs. Pockett type, but coloured an intense canary-yellow (Silver-gilt Flora Medal).

Mr. H. J. Jones, Ryecroft, Lewisham, occupied a space 30 ft by 6 ft, and received a Silver-gilt Banksian Medal for a very tastefully-arranged collection of cut blooms. Tall vases were poised along the centre, and on either side beneath them were masses of the various varieties. The more noteworthy were Dorothy Pywett, a distinctive new Jap of large size, deep in build, with smooth broad petals that recurve, but have spoon-shaped incurving tips. It is of soft, palest creamy colour, bordering almost on white. There were also Geo. Lawrence, bronzy-red; Nellie Perkins; Countess of Arran, a long-petalled rose-mauve and white flower; C. Jarvis, of the Chas. Longley type, but bright amaranth coloured, and having narrower petals; Mrs. F. Hudson, a spotless white giant incurved, of great merit; General Hutton, good yellow; Miss Jessie Cottie, which furnishes an excellent decorative flower, of large size, and intense orange-apricot colour; H. J. Gillingham, a beautiful deep primrose-coloured incurving Jap (a yellow Western King); Viscountess Cranbourne, rich glowing yellow; and Wm. Higgs, an incurved of very rich colour. Miss Hetty Dean and many others were seen in Mr. Jones' group at their best.

Messrs. Cannell staged the following Chrysanthemums:

Mrs. E. G. Fairburn, a rich golden-bronze incurving Jap; Dr. Chisholm Ross (after E. Molyneux type); Madame Paolo Radaelli; Eldorado; La Fuson, white and lilac tinted; Lady Marcus Samuel; Mrs. E. Seward; Miss Muriel Tait; and Mrs. A. Jack, a large incurved lilac-purple. They received a Silver Banksian Medal.

## Botanic Gardens.

(Continued from page 425.)

The University Botanic Garden of Cambridge was founded in 1763, by Dr. Walker, Vice-Master of Trinity College. He gave the site, comprising nearly five acres, in trust to the chancellor, masters, and scholars of the University for the purpose of establishing a physic or botanic garden. Thomas Martyn, who was then professor of botany, was appointed reader on plants; and Charles, son of Philip Miller (who had aided Dr. Walker in selecting the ground) was appointed the first curator.

Previous to this date, probably the number of exotic plants cultivated in this country did not exceed 1,000 species, but during the eighteenth century about 5,000 new species were introduced. Professor Martyn died in 1825, and was succeeded in the chair of botany by Professor Henslow, who found the garden in a very neglected state, and utterly unsuited to the demands of modern science. Botany must have been at a very low ebb in those days, for Thomas Martyn held the professorship for sixty years. He was a very old man when he died, and, from age and infirmities, had long previous to his death ceased to lecture or even to reside in the University. There had been no lectures on botany for at least thirty years, although he deputed some able botanist to lecture in his stead; but the lectures, for some reason or other, were badly attended. Afterwards the late Sir James Edward Smith came forward to supply the deficiency, and applied for leave to give a course of lectures on botany. He had the consent of Professor Martyn and the then vice-chancellor, but there was such a strong opposition from the tutors of the colleges, on the ground of his being neither a member of the University or of the Church of England, that he was forced to withdraw; but I am glad to say that most of the masters and tutors of this University to-day are more broad-minded and tolerant than their predecessors. There was but little science (as we know it now) taught in those days.

It was a great pity that Sir James Smith was refused permission to lecture, as he was an eminent botanist; but—to return to our neglected garden. As Henslow found it, it was then in the heart of the town (the site of the present new museums in Downing Street); consequently, only a limited number of plants could be grown in the open ground, while the glass houses were too small and few in number, and he often reported its inefficiency to the governors, but it was many years before anything was done in the matter. An opportunity occurred in 1831 by which the University was enabled to purchase a more extensive piece of ground, consisting of about thirty acres, in the outskirts of the town, which is the present site of the garden. Many years elapsed, however, before the plants were removed from the old garden. Henslow was always advocating the enlargement and improvement of the garden, observing “that the larger the number of species cultivated in a botanic garden the greater will be the facilities afforded, not merely for systematic improvement, but for anatomical and other experimental researches essential to the progress of general physiology. It is impossible to predict what particular species may safely be dispensed with in such establishments without risking some loss of opportunity which that very species might have offered to a competent investigator at the exact moment he most needed it.”

Professor Henslow advised the appointment of a curator, who should be competent to meet the demands which such an establishment might require. He also visited the Royal Gardens, Kew, to get advice and information that should put this garden on a footing with those at Glasgow, Edinburgh, and Dublin. The result of all these labours on the part of Mr. Henslow was the appointment of the first curator of the new garden. The

place was given to Mr. Murray, a skilful gardener. Together they planned the garden, which has remained much the same ever since, except in a few minor details, such as the site of the new range of glass houses and a few new beds here and there. The first tree was planted in 1846 by Dr. Tatham, then vice-chancellor. The remainder of the trees, shrubs, and herbaceous plants were added as money allowed, the trees being planted to form a belt round the garden as much in their natural orders as possible. Mr. Stratton was the next curator to follow Murray, who did not live long after his appointment.

The first glass houses were constructed in 1855. These were, however, replaced by a splendid new range of houses in 1889-1890. There is a great deal one might say in a general way without going into details, but a few brief remarks must suffice before closing this subject. There is not another garden in the British Isles, or perhaps in the world, that is called upon to provide such a vast amount of material for the different lectures and research work as Cambridge, in addition to the keeping of a collection of plants, which in this country is rivalled only by the vast collection at Kew. We have been famous for our rare and interesting plants, many of which have flowered here for the first time in cultivation, and then figured. Then, again, we have been famous for collections of various groups of plants; for example, I would mention Insectivorous plants, Succulents, Crinums, Pæonies, Fuchsias, and Bamboos.

Many a so-called stove plant has been tried successfully on the sheltered borders of the plant houses. The rockery and bog garden have been the subject of much comment in the gardening press. Many years ago, before the present appreciation of Bamboos took hold of the public, there were some good specimens grouped naturally in sheltered positions near the pond. So well did they grow here that their culture was taken up with zest by the Kew authorities, where they are now well grown in a place specially constructed for them, known as the Bamboo Garden. Kew is rich in number of species, and has spared no expense and trouble to make the collection a success. No extra money or labour has been spent on them at Cambridge, and although we have a collection of over forty species and varieties, it is far surpassed by the Kew collection.

Our hardy succulents have created quite a sensation in the horticultural world, and some of them are still the finest examples of their kind in this country; but in these, as with the Bamboos, we shall have to bow to Kew and other places where space and money is less limited than here, but we are consoled by the knowledge of having set the example and shown what can be done.

Gerbera Jamesoni, or the “Transvaal Daisy,” first flowered here many years ago, and ever since it has been a great success. We distribute hundreds every year from seed ripened out of doors. A yellow-flowered variety was discovered at Barberton by the Curator of the Botanic Garden at Johannesburg whilst a fugitive in the Transvaal during the recent war. He collected a few seeds and sent them to the Curator of the gardens here. Young plants were raised which flowered in due course. Mr. R. I. Lynch very carefully examined and compared it with the type, and found that it was a variety only, not a distinct species. It is now known as Gerbera Jamesoni “Sir Michael,” in honour of Sir Michael Foster, whose services to horticulture and botany is well known. We hope to propagate and distribute this variety.—ALBERT HOSKING, Cambridge.

POSTSCRIPT.—I had believed that Gerbera Jamesoni was figured from here. I find, however, that this is not the case, and that the figure in “Bot. Mag.” in 1889 was made from a plant growing at Kew. Our plants having flowered at the same time, but whereas the Kew plants were lost, ours have succeeded and flowered every year, and plants have been sent to Kew from these gardens more than once.—A. H.

### The Vintage of 1902.

The nineteenth century's vintage records close with a Grape gathering throughout Europe phenomenally successful, both as to quality and quantity. The first vintage of the new century promised, up to a certain date, almost to rival the final one of the old, but in quality failed entirely to realise expectation, owing to adverse conditions of weather at the last. The 1901 wines, therefore, must, though not so very far behind 1900 in quantity, be classed as of a low order of merit.

### **Cypripedium Charlesworthi.**

In Captain Holford's magnificent collection of Orchids in the Drill Hall, Westminster, on Tuesday last, the *Cypripedium* which we herewith figure was noted as one of the loveliest of any. It is a fit compeer in a choice collection, along with the best forms of *Cypripedium* insigne. The large dorsal sepal, so beautifully rose-coloured, with the yellowish-brown pouch and white staminode, never fails to elicit praise from those who have seen it for the first time.

### **The Week's Cultural Notes.**

Many of the beautiful *Laelias* from Mexico are now either in flower or rapidly advancing. The flowering of these very useful Orchids forms the apex, if one may so term it, of the season's growth. After the flowers are past the plants rest until a new set of growths are produced, and, incidentally, it may not be out of place here to mention that the longer in season they are kept dormant after flowering the better, as the weather will be brighter, with more sunlight for them to produce their growth in.

Just now they will not require a great amount of water at the roots, but they must not be quite dried until the flowers are past and the pseudo-bulbs thoroughly mature. Should green or black fly appear on the flower spikes, pass a damp sponge over them with an upward motion. There is often a gummy exudation about the flowers, and the sponge will remove this as well as the insect. The pretty small species, such as *L. pumila* and *Dayana*, as they go out of flower must be hung up in the *Cattleya* house, but not too severely dried, as the small bulbs and sensitive leaves will not stand the strain.

The management of the temperature is just now a matter of anxiety to growers, the weather being so uncertain. A cold nipping wind one day is followed by damp, muggy conditions the next, and it is only by constant attention that anything like regularity can be maintained. A damp, warm atmosphere in most departments is quite wrong now, as it predisposes the plants to unseasonable growth, and often leads to damping. A fairly dry and buoyant one, on the other hand, does not distress them, but is sufficient to keep them at rest. Use as little fire heat as possible, but always have a little warmth on the pipes to keep the air moving.

For the guidance of the inexperienced, I may say that a suitable winter temperature will be in the warmest house 65deg by night and 70deg on dull days, rising, should the day be sunny, another 10deg, or even more, but not by fire heat. The *Cattleya* house may be kept at 55deg to 58deg by night, rising to 65deg by day, while 55deg by day and 60deg by night will do for the cool house. These figures need not be too rigidly adhered to. When the weather is very cold it is unwise to fire too freely, and it is far better to allow a slight drop than to dry up the plants with excessive fire heat.—H. R. R.

## **Cankered Apple Trees.**

In reference to the above important question in your last issue by "Ignoramus," I should like to place my experience on record for the benefit of your correspondent and others who may care to read it. For a number of years I have taken a great interest in fruit growing on rather a large scale. Some fifteen years since I came in charge of a collection of Apple, Pear, and other fruit trees, all of which indicated bad planting. In most cases they were too deeply planted, in others the soil had not been prepared for the trees. The result was bad cases of canker (in the Apples), which always follows too deep planting. These trees had become too luxuriant, and in order to check their expansion the knife had been used freely, which, of course, aggravated the evil. Now for the remedy. First, I carefully pruned all these trees, using the knife very moderately, indeed, merely thinning the inside of the trees (pyramids and low bushes). I did not touch the leading shoots. I allowed these to grow on at will, and early in the autumn I opened a trench carefully all round each tree, beginning some 5ft from the stem, with forks, baring each large root as it was discovered. When all the roots had thus been found, and the true state of affairs had been ascertained, all the largest roots were cut through with a saw or sharp knife. A barrowful of turfy loam was added to the old soil, and as this was returned every root available was raised to as near the surface as possible. The soil was rammed very firmly with a wooden rammer, and a mulching of half-decayed manure

was placed round each tree. The leading shoots above referred to were shortened slightly, and the trees were left to take their chance till the following autumn.

I was told that these were extreme measures to take with such large trees, but all did well during the summer. Instead of shoots 8ft and 10ft in length being made, the leaders already mentioned were studded with fruit buds, as also every part of the trees. I had not yet, however, finished with these trees. The following autumn I decided to lift the whole lot bodily, which I did in this way. I opened trenches around each tree as before. I found the roots in quite a different state to that of twelve months previously. The new soil was a mass of fibrous roots, and formed into a solid ball, not unlike the root ball of a *Rhododendron*. I placed four builders' scaffold planks under these balls and a man on the end of each plank. Steadily, but surely and safely, the tree was hoisted up out of its old position; new soil was rammed underneath the ball, consequently the roots of the tree were brought about 18in nearer to the surface. An authority saw these trees some two years later, and pronounced them to be models of good cultivation. Not one atom of canker could be seen in any of the trees so treated.

There were, however, three or four trees which I did not consider worth the time and attention, and these were left. One still remains, a mass of canker. This is a "Transparent" Apple, and it certainly bears a crop of fairly good fruit every year; but when compared with its neighbours standing near to it, it compares very poorly indeed.

I do not say that feeding cankered Apple trees freely with

**Cypripedium Charlesworthi.**

liquid manure would not have good results, but lifting them, and afterwards feeding, would be infinitely better. First get the trees into a fruitful and healthy condition, and then feed freely; and for this there is nothing on earth better than farm-yard manurial liquid.

There is sometimes confusion with canker and a similar disease caused by woolly aphis, or American blight. This is very prevalent this season, and is causing a good deal of anxiety amongst gardeners. For the first time in my experience as a gardener I have seen a suspicion of it in the fruit trees there. Where it came from I do not know, unless it blew across the fields from adjoining property some 200 or 300 yards away.

I am convinced that there is nothing to compare with root-pruning and lifting for canker, and a solid foundation for the trees to rest on. The bottom of the holes should be rammed as firmly as possible. I am aware that fruit trees are, and must be, planted on thin soil, and then on such soil canker will quickly put in appearance. But we have a partial remedy by using the dwarfing stocks—the *Paradise* and the *Quince*. Both are surface rooting, and if these are liberally treated by way of surface dressings of good soil and liquid manure, worse use may be made of the soil, and little canker will be seen.

With regard to the application of liquid manure, it should always be given at some distance from the stem of the trees, that is, as far as the spread of branches.—J. E. A.

# NOTES & NOTICES

## Devon and Exeter Gardeners.

The meeting held in connection with the Devon and Exeter Gardeners' Association at the Guildhall, Exeter, on November 12 was well attended. Mr. T. Slade, gardener to the Right Hon. Lord Poltimore, read an excellent paper on "Table Decorations," which we hope to furnish notes of.

## Coronation Trees.

Trees to commemorate the King's Coronation have been planted at Edlington, Yorks. by the authorities; also in Victoria Park in the East of London; and at Musselburgh, in Midlothian. Twenty purple Beeches were planted by the King, the German Emperor, the Queen, the Prince and Princess of Wales, and other Royal members, at Sandringham on Monday, November 10.

## A Plan Drawing Competition.

The date for the sending-in of plans for a gardener's bothy (of which particulars were given on page 416, October 30) is drawing near, and we would particularly request young gardener-draughtsmen to give the matter their consideration, that a really useful plan may be put before our readers. Plans may be sent in now if completed.

## The Horticultural Hall.

The Council of the Royal Horticultural Society have issued in the form of a brochure the plans and statements for the erection of the new hall which is to commemorate the Centenary of the Society's existence. Owing to the Rose analysis and the crowd of Chrysanthemum show reports in our pages this week we are debarred from publishing the plans as accepted by the Council, but we trust to be able to do so next week. There are many imposing features, but an improvement could be effected in the roof, which detracts from the nobility of the front elevation by its resemblance to that of a board school.

## Bowls in Liverpool Parks.

It is interesting to note that the Parks and Gardens Committee of the Liverpool Corporation, after hearing a most favourable report from the esteemed superintendent, Mr. Herbert, have decided to spend some £60 on the purchase of bowls, owing to the highly successful season which has just passed. This is a step in the right direction, as the old game has very many devotees in the district, who are now petitioning the Council to lay down more sward for the benefit of those who cannot enter into the more vigorous outdoor pursuits. A small charge is made, and by this means the ratepayers are relieved of heavy taxation. It is an object worthy of extension if one must judge the zest of the competitors as a criterion.—R. P. R.

## The Loss at the York Gala.

Under the presidency of Alderman Sir C. Milward, a meeting of the council of the Grand Yorkshire Gala was held at Harker's Hotel last week. The balance sheet showed that there was a loss on last June's gala of £634 8s. 4d., due to the inclement weather which prevailed at the time. This is the greatest loss which the society has ever sustained. The next business was the appointment of a secretary in succession to Mr. C. W. Simmons, who retired on the ground of pressure of other business, and Mr. Fred Arey, of 3, New Street, was elected to that position. In recognition of the services of Mr. Simmons during the fourteen years he was secretary, the council elected him a life member. Votes of thanks were accorded the ex-Lord Mayor, president for the past year; to Sir C. A. Milward, chairman of committee; Alderman Border, vice-chairman; Alderman Sir J. S. Rymer, treasurer; to Messrs. Harper (N.E.R.); and to Messrs. Baekhouse, Webb, and Suttons for donations. It may be stated that, notwithstanding the loss of the last gala, the society have still a substantial balance in hand. With regard to next year's fixture, a committee was appointed to arrange dates. A vote of thanks to the chairman concluded the proceedings.

## Irrigation in America.

In Texas and Louisiana there are now more than one hundred canals and pumping stations, each capable of flooding one thousand acres of rice. These are owned by irrigation companies, which supply the water as needed to the rice farmers.

## The Automobile Lawn Mower.

An illustration of one of the above inventions appears in "American Gardening" for October 25. This machine has been in use on the lawns of Mr. P. A. B. Widener, Ogontz, Pennsylvania, and have greatly assisted the turf, heavy rollers being attached to the machine.

## Gardeners' Library at Pymmes Park, Edmonton.

In connection with the Middlesex County Council School of Gardening, a garden library has been established at Pymmes Park, Edmonton. The library is open for the benefit of gardeners in the neighbourhood on Tuesday and Thursday evenings from 7.30 to 9.30, and on Wednesday mornings from 10.30 to 1. A good selection of the best books on gardening and botany has already been made, and others will be added from time to time. Applications to use the library may be made to Mr. J. Weathers, County Instructor in Horticulture, Pymmes Park, Edmonton.

## Devonshire the Beautiful.

Devonshire in particular is exceedingly beautiful at the present time. The Oak and Beech woods, which are so very plentiful, are resplendent in many shades of bronze, russet, gold, and crimson, while beneath the trees the ground over many acres is likewise strewn in colours of the richest tones. At Exmouth on Monday morning the sun shone as in mid-May, and the black-birds sang voluptuously. Berberis Darwinii was noticed in flower, in company with Jasminum nudiflorum and Passiflora cærulea, each in the open air. Happy Devonshire! for indeed she is endowed with plenteousness. While Shetland is cutting a green harvest, the southern county has Wheat fields with growths 4in high.

## Bristol and District Gardeners' Mutual Improvement Assoc.

This association held its usual meeting at St. John's Rooms, Redland, on Thursday evening last, Mr. E. Poole, F.R.H.S., presiding over a good attendance. The lecturer for the evening was Mr. E. Binfield, gardener to Mr. Francis Taggart, J.P., F.L.S., Old Sneyd Park, his subject being "Stove and Greenhouse Ferns." The members having looked forward to this lecture, were not disappointed, for the masterly way in which Mr. Binfield handled his subject proved conclusively that he had made a careful study of these most useful plants, his lecture being brim full of useful and practical information. He dealt minutely with the general treatment of the leading varieties, including propagation, potting, watering, insect pests, and numerous other items required for successful cultivation. Mr. Binfield remarked on the indispensable uses of Ferns. Cut flowers, groups of plants, &c., were incomplete without them. He strongly advised his audience to follow as much as possible Nature's own instructions, which can always be relied on. The Maidenhair varieties being the most popular, Mr. Binfield gave many excellent hints concerning the requirements of these favourites. He recommended watering with soft water which was the same temperature as the house. Shading was necessary for their well-being, if not carried to excess. He gave a complete list of the best varieties for different purposes. To eradicate insect pests, Mr. Binfield argued that the XL All fumigator was undoubtedly the best. His lecture was much appreciated, as was shown by the excellent discussion which followed, and Mr. Binfield was accorded the heartiest thanks of the meeting for the evening's enjoyment. Prizes for six sprays Chrysanthemums were awarded as follows: first, Col. Goss (gardener, Mr. Shaddick); second, Mrs. Coleman (gardener, Mr. Spry). Certificates of merit went to Lady Cave (gardener, Mr. E. Poole) for a fine collection of vegetables; to Mills Baker, Esq. (gardener, Mr. Board), for a Cypripedium; and to Gilbert Howes, Esq. (gardener, Mr. White), for two Ferns; the judges recommending a special certificate of merit for W. A. F. Powell Esq. (gardener, Mr. Raikes), for five excellent Chrysanthemums. On November 27 Mr. Harding, of Clifton, is announced to lecture on "Fungus," which will, no doubt, be an interesting one.—H. K.

**Gardeners' Royal Benevolent Institution.**

A grand concert in aid of the above institution has been arranged to be held in the Constitutional Hall, Chertsey, on Thursday, November 27. Tickets and programmes, or any information relating to the concert may be obtained of the local secretary, Mr. A. J. Brown, F.R.H.S., Jessamine Cottage, Chertsey.

**Royal Meteorological Society.**

At the ordinary meeting of the above society, held at the Institution of Civil Engineers, Great George Street, Westminster, S.W., on Wednesday, the 19th inst., at 7.30 p.m., the following papers were then read:—"English Climatology, 1881-1900," by F. Campbell Bayard, F.R.Met.Soc.; "The Rainfall of Dominica," by C. V. Bellamy, M.Inst.C.E., F.R.Met.Soc.—W. M.

**Pictorial Practical Rose Growing.**

This is the latest of Messrs. Cassell and Co.'s illustrated shilling gardening books, which are being produced under the editorship of Mr. Walter P. Wright. The subject-matter of the booklet is well conceived and admirably illustrated, special varieties like Maréchal Niel and Gloire de Dijon and others receiving special notice. Diseases and pests are briefly referred to, and useful varietal lists of Roses are included.

**Fixtures for 1903.**

The following dates have been fixed by the Royal Horticultural Society for 1903, subject to possible alteration: January 13, January 27, February 10, February 24, March 10, March 24 (Hyacinth and Tulip Show), April 7, April 21 (Primula and Auricula Society), May 19 (British Tulip Show and Conference), May 26, 27, and 28 (Temple Flower Show), June 9, June 25 and 26 (Holland House Show), July 7, July 25 (National Carnation Show), August 4, August 18, September 1 and 2 (National Dahlia Show), September 15, September 29 and 30 and October 1 (Fruit and Vegetable Show and Conference at Chiswick), October 13, October 27, November 10, November 24, December 15; 1904—January 12, January 26, February 9.

**Cardiff Gardeners Association.**

The third meeting of the session took place on Tuesday, November 11, at the Grand Hotel, Mr. C. E. Collier in the chair. Mr. H. Harris, gardener, Wenvol Castle, Glamorgan, delivered a lecture entitled "The Flower Garden." In doing so many of the old favourite species were mentioned, and suggestions introduced as to the best ways and means of planting and arranging to produce the best effects, either in beds or herbaceous borders. The lecture throughout was of an appreciable character, and the discussion was enthusiastically taken up by a large number of members present. Mr. Harris staged a fine stand of six blooms of Chrysanthemum Mrs. J. Lewis, and was awarded a first class certificate; also a hearty vote of thanks for his lecture, which brought the proceedings to a close—J. J.

**Newport (Monmouth) Gardeners' Mutual Improvement Assoc.**

On Wednesday, November 12, the members of the above association held their usual meeting, when Mr. Wiggins gave an interesting paper on "The Reproduction of Ferns." Mr. Wiggins, in his opening remarks, gave statistics showing the estimated number of varieties of Ferns at present known, also describing wherein Ferns differed in growth from other plants; then proceeded to point out the manner of germination and fertilisation. It was a very interesting and instructive paper, and was much enjoyed by those present. A good discussion followed, which was taken part in by Messrs. Harris, Powell, Sharratt, Reece, Kenward, and the chairman. A hearty vote of thanks was accorded Mr. Wiggins for his paper. A fine display of plants and thirty-six dishes of Apples and Pears was placed on the tables by Mr. Powell, gardener to Col. C. T. Wallis, president of the association, and the society's certificate of merit was awarded. A vote of thanks was accorded Mr. Sharratt for a well-flowered plant of *Cattleya labiata*. Mr. Daniels presided. On Thursday evening, by the kind invitation of F. Phillips, Esq., a vice-president of the association, the members visited Nant Coch to view the grand display of Chrysanthemums. A most excellent supper was provided and a most enjoyable evening was spent.

**Southampton Chrysanthemum Show.**

We are in receipt of some very excellent photographs of the choicest blooms at the recent show held in Southampton, and these will be furnished in the next issue of the Journal.

**The Late Mons. E. M. F. L. Rodigas.**

We regret to record the death of the above-named gentleman, lately honorary director of the Horticultural School de l'Etat, and honorary member de la Chambre Syndicate des Horticulteurs Belges, Gand. His funeral took place on the 17th inst.

**Northern Notes.**

Dundee is one of the most advanced centres of horticultural activity in Scotland. On November 5, Mr. A. D. Richardson, late of Edinburgh Botanic Garden, gave a lecture in the Grove Academy, Broughty Ferry, on "Hothouse Buildings," being one of a series of horticultural lectures to be delivered. \* \* On November 6, Dr. John H. Wilson, lecturer on Agriculture and Rural Economy in St. Andrews University, delivered a lecture at Forfar entitled, "Personal Experiences as a Hybridist," under the auspices of the Forfar Horticultural Improvement Association. These lectures were well attended.

**National Fruit Growers' Federation.**

A meeting of the National Fruit Growers' Federation took place at the Westminster Palace Hotel on Tuesday (C. W. Long, M.P., presided) to form an advisory committee to consult with a council of railway managers in connection with the deputation that took place recently for the purpose of adjusting the differences between grower and carrier. It was suggested an important public meeting should be held in each county early in December, and invite all growers and others interested with the cultivation of fruit to attend, for the purpose of enrolling new members and ascertain the reforms required for each separate county.

**Reading and District Gardeners' Mutual Improvement Assoc.**

At the last fortnightly meeting of the above association, which was largely attended, and presided over by Mr. F. Lever, the subject for discussion was Japanese Chrysanthemums for exhibition and their culture, and was introduced by a well-known local exhibitor, Mr. D. Ager, gardener to Mr. Milton Bode, Caversham. The subject was dealt with in a very practical manner, and the various details of culture were followed with the closest attention, and a lively discussion was the result, in which the following members joined:—Messrs. Ager, jun., Judd, Hinton, Exler, House, Powell, Herridge, Basil, D. Dore, Neve, Cretchley, Burfitt, and the chairman. The exhibits were very interesting, viz., Honorary, a fine group of *Celosia pyramidalis plumosa* (Mr. W. Townsend, The Gardens, Sandhurst Lodge); a very pretty lot of *Nerine flexuosa* (Mr. G. Hinton, The Gardens, Walmer; and for certificate a group of well-grown *Cyclamens* (Mr. G. Attwood, Cruchfield House, Bracknell); seedling Chrysanthemums (Mr. House, The Gardens, Oakfield). The certificate was awarded in both cases.

**A State Forest Wanted.**

Colonel Bailey, in opening for the session the forestry class in Edinburgh University recently, spoke of the disadvantages under which forestry students worked in Edinburgh as compared with those in foreign countries. He said that on the Continent they had fully equipped schools with woods in which practical instruction was given, and the student's whole time, for three or four years, was practically at the disposal of the professors. Here they were limited to a course of one hundred meetings, and the students were for the most part engaged in other university work, while they had to be content with the excursions on Saturdays to woods in the neighbourhood, which had not been managed on correct principles for a sufficiently long time to render them suitable object-lessons to the class. The want of a State demonstration forest was very badly felt, for woods privately owned could never answer the purpose satisfactorily. In consequence of representations made by the Arboricultural Society, a Departmental Committee has been appointed by the Board of Agriculture; and it might be hoped that one result of that Committee would be the provision, within a convenient distance of Edinburgh, of a State area in which practical instruction could be given to the class.

### The Winter Moth.

Having observed several near a Pear tree, I placed a grease band on it, and caught twice as many moths—male and female—as I got on any Apple tree. The question arises: Does the winter moth do any injury to the foliage and fruit of Pear trees? If not, why do they frequent them? and if it is usual for them to do so, would it not be desirable to grease-band Pears as well as Apples? No one in England or elsewhere thinks it worth while to do so. One male carried a female safely over the grease band into the tree.—C. C. ELLISON, Bracebridge, Lincoln.

### Coral Spot Disease on Shrubs and Trees.

Of late years the bright, coral-like warts, about the size of a millet seed, have been conspicuous on the surface of dead branches, and even on the stems of trees, and this autumn (October 27) are plentiful on the Lime, Horse Chestnut, Sycamore, and Maple, and more especially on the Red Currant. The outgrowths are very beautiful, noticeable at some distance, and it must also be said very serious in consequences. The small bead-like and bright red studs accord with tissue that has been destroyed by the mycelium of the fungus named *Nectria cinnabarina*, of which the numerous bright, coral-like outgrowths are the conidial condition. The conidia, or spores, are very minute and produced in vast numbers. In the late autumn or early winter these warts assume a darker red colour, and become minutely warted, due to the formation of the ascigerous form of fruit. In this form the fungus passes the winter, and in the spring the spores produced in asci are liberated. The mycelium is also perennial in the tissues, as the disease spreads from the base or centre of infection, and sometimes kills the branch affected, or even the whole tree or bush, as in the case of the White Lime (*Tilia argentea*) and Red Currant (*Ribes rubrum*), that have been particularly noted.

The fungus is generally a saprophyte, living on green cut-off branches or stems, the fungus not presenting signs of infection until the following autumn, when the surface of the bark is studded with the bright, coral-like warts. On living trees it is a wound parasite, the spores or conidia germinating on the surface of the wound, and the mycelium passes into the living tissues, penetrating between the inner bark and outer wood, destroying the cambial layer, and also killing the bark. The portion of killed branch or stem in the autumn following attack is bedecked with the bright coloured fruit of the fungus.

**PREVENTION AND REMEDY.**—As infection takes place by a wound, dressing the cuts made in pruning, whether lopping off branches of trees by saw or cutting off twigs of shrubs with a knife, with a prophylactic substance is imperative to avoid attack. For this purpose Stockholm tar thinned with paraffin oil to the consistency of paint, thus readily applicable with a clean, half-worn paint brush, answers admirably, applying to the wounds only, and shortly after they have been made. On the large branch wounds of trees gas tar may be used, in each case brushing well into the cut tissues, so as to form a protective coat over them, not leaving any part of the wound uncoated.

Diseased branches should be cut off to some little distance below the appearance of the bright-coloured fruit, burning the diseased branches, though there is no danger of infection from cut-off or dead branches lying on the ground, always providing that infection cannot take place through the wounds on the trees or shrubs, they being duly safeguarded by a prophylactic dressing. The fungus is very common on one-year cut Pea sticks and stakes, therefore to destroy these by burning is both desirable and even necessary.

In the case of infection on a stem the bark should be cut through into the living tissues, and the diseased entirely removed, burning this removed portion; then dress the wound with the composition of Stockholm tar and paraffin oil or gas tar. As the mycelium spreads somewhat beyond the point where it indicates its presence externally, the incision through the bark should be made well into the living tissues, then a circumferential boundary of sound bark and wood will be secured, and the wound thus made needs only protection from attack outwardly, and new bark will in due course be formed around the wound, and in due time cover it entirely.—G. ABBEY.

### Illegal Showing.

Now that all the gardening papers are full of reports of the different shows that have taken place all over the country, one often wonders, when reading the prize list, and more so when walking round admiring the different exhibits, if all are grown by the exhibitor, as there is so much borrowing at show time. One grower knows where he can get far better blooms than his own. I heard an exhibitor say last year that he had that morning sold two dozen blooms for exhibition, which was not much to his credit. Again, take the fruit and vegetable classes. One man I know scours the country before fruit-gathering time picking up a good dish here and another one there, and then at the shows prize cards are fixed to them as grown by him. Another has a friend living down south, who sends him an extra good dish or two. Then, again, take vegetable collections. One often sees some variety of which you know the exhibitor has none. I think the time has come when all such practices should be put a stop to. No doubt, the readers in the Journal will say: How is it to be done? Surely some way could be found to stop what I call illegal showing. I am sure any lady or gentleman would stop their gardener from showing anything but what was grown in their garden. It is, however, the man that is his own master who makes a business of showing that would be the most difficult to stop.—A YORKSHIRE GROWER.

### Pruning Fruit Trees at Planting.

I am sorry your correspondent "Observer" has misunderstood my article on the above subject. He quotes two sentences detached from different parts of the article, which certainly appear contradictory on a first reading. The first, however, deals with the comparative results of pruning at planting time and leaving the trees unpruned—that is, allowing the whole of the previous season's growth to form a part of the future tree; while the second deals with the results of deferring the pruning of a tree till after a season's growth, and then cutting back some of the wood which was on the tree at the time of purchase. Surely these two sentences cannot be contradictory. In case my meaning may have been obscure to others as well as to your correspondent, perhaps I may be allowed to repeat the gist of my contention, namely, that the non-pruning of newly planted trees leads to weak growth with the bearing of fruit before the branches are strong enough to support it, whilst the immediate cutting back of the young wood at planting time strengthens the growth, whilst encouraging, in most sorts of fruit trees, the formation of fruit spurs. When pruning is deferred till after a season's growth, and then that growth, with that of a part of the previous season, is removed, the vigour of the tree is undoubtedly increased; but time is lost, while the tree in the meantime, at any rate with dwarf trees, may become too strong. Thanking you, sir, for allowing me this opportunity of explaining my meaning.—A. PETTS, Chelmsford.

### Do Plants Grow at Night?

From my earliest associations with plants this question, to a certain extent, exercised my attention. I have little doubt the same thing has occurred in the experience of many others similarly situated. Gardeners, farmers, and foresters are all brought in daily contact with plant life, and it is scarcely possible that any one of them could pass a lifetime in its presence without being impressed with the question whether or not does the plant cease from labour during the night, like all the rest of animated Nature, and participate in that divine repose so essential for the welfare of animal existence. Either of the above mentioned professional gentlemen will almost off-handed tell one that the evidences are favourable to the supposition of night growth. Some of them, indeed, will go to the length of saying that it is during that time plant architecture is apparently most active.

And it must be granted that the apparent evidences are somewhat conclusive in character. Young Vine shoots, and many other softwooded plants, give strong indications of night growth between the time that the gardener leaves off duty in the evening and his return in the early morning, so that little wonder need be entertained at the opinions vouched by the evidence of the person's eyes. All careful observers have experienced the same state of things, but, like other apparently real things, some always exist to doubt the very evidence of their eyes, unless such can be philosophically substantiated. There is, therefore, no wonder to find that some exist, of which the writer is one, who cannot throw in their lot with those who believe that plants grow in the night. Without entering into the chemical processes which take place in the plant economy, and which, upon the whole, are unfavourable to the idea of growth during the partial suspension of solar energy, there is sufficient corroborative evidence in the fact that the sun is the source of life to reasonably repel the stoutest asseverations of those who maintain contrary views.—E. C. CHISHOLM.

Theoretically, the plant must lose energy in proportion to the absence and distance of the sun's influence, and loss of energy tends to repose and inactivity. It is, therefore, more than probable there is a period in the night—however small—when the vitality of the plant succumbs to the soporific anodyne so providentially furnished by Nature. Under such circumstances there can be no growth, the process being necessarily suspended, and the available energy being required alone to keep in motion the pulse of life. The process of cellular construction, which must of a necessity command the highest combined influence and energies of sun and plant in the operation, is doubtless inactive till once more the power of the sun returns to renew the loss of energy, when the great army of phytozoons mount again the scaffolding to perform the duties of the day.

We are all familiar with the well-known phrase, "the dead of night." The appellation carries with it a greater significance than, perhaps, is ever assigned to it, for at that particular time is Nature not dead? True, in the summer months, when the withdrawal of the sun's influence is so little felt, scarce any appreciable diminution in growth can be detected, for, in point of fact, the essential influence is to all intents and purposes continuous. Therefore, during the few hours which the sun's disc is below the horizon it is very probable that its influence operates in a similar way to which it does in the case of plant life when developed in a cellar. But in the case of day and night of equal duration, or in that of the period of winter, the sun's influence is much lessened and the period of rest in proportion increased.

Were such unduly protracted, there is every reason to think that plant and animal life would cease to exist, for what is this sleep and rest which supervenes—the disappearance of the life-giving power of the sun, but a loss of vital energy corresponding to the duration of the absence of that power? And if we conceive the possibility of a midsummer night being protracted to the duration of a midwinter night, the probable effects would be disastrous, and, similarly, the same direful effects would supervene the extension of the winter season into the summer. The diurnal, or, rather, the nocturnal period in which the plants rest, is a prefigure of that greater rest which Nature prepares for it in the winter months. With the decrease of the sun's power begins the symptoms of loss of vital power in the plant. The leaf changes colour, it withers, and falls. The sap itself is congealed into wood, and at length, when all is finished, the plant falls over into a long and profound sleep.—ATLAS.

## Leading Commercial Rosarians.

### Mr. Geo. Dickson, Sen.

Mr. George Dickson is the eldest son of Alexander Dickson, who founded in 1836 the very flourishing nursery business of Messrs. Alexander Dickson and Sons, Limited, Newtownards, Co. Down, Ireland, and was born on July 7, 1832. He is now chairman of the company, and from the death of his father, in 1880, until 1900, traded as Alexander Dickson and Sons. For family reasons, he converted the business into a private limited company on the latter date, the shares being all held within the family.

Mr. Geo. Dickson has always been closely identified with Florists' Flowers, particularly Gladioli, Dahlias, and Pansies, more especially in his earlier years, when he raised many fine varieties, and was a successful exhibitor at the leading Irish and Scottish shows. It is almost fifty years since he gave his attention to Roses, making a speciality of them. It was from him that his sons, George and Alexander, received instruction in hybridising, which has enabled them to produce the large numbers of seedling Roses that are now grown in all parts of the world, and to whose merit the present analysis bears record.

In latter years the management of the business has been largely left in the hands of his four sons, while Mr. Geo. Dickson, sen., gives much of his time to the breeding of Shorthorns, of which he possesses an excellent herd.

He is a magistrate for Co. Down, member of the Down County Council, sitting for the Newtownards and Mount Stewart Division since the passing of the Local Government Bill for Ireland, Chairman of the Board of Guardians, and Chairman of the Technical Instruction and Agricultural Committee of the Down County Council, where his large experience is much appreciated.

At present at Newtownards upwards of two acres is devoted to the growth and testing of seedling Roses. Last year the firm budded from upwards of 2,000 seedling plants that had germinated during the spring of 1902. All seed is sown in pots, and the parentage of each correctly noted and preserved. All through the flowering season the head of the firm spends much of his time daily going in and out the various quarters, making notes of the results.

### Mr. B. E. Cant.

The memory of the late Benjamin R. Cant is revered by all of those steadfast rosarians who were contemporaries with him. He died untimely, but left a first-class business in the hands of two very capable sons. The firm trades under the name of Messrs. B. R. Cant and Sons, the Old Rose Gardens, Colchester. Mr. B. E. Cant principally supervises the cultural work of nursery-gardening, and during the exhibiting period he is to be seen one day here, another day there, with collections of Roses. Not a little of the success achieved by the firm in this connection is due to his excellent judgment, care, and coolness in setting up large numbers of flowers in a short time.

Mr. B. E. Cant has of late years devoted a good deal of time and consideration to the hybridising and crossing of Roses. His efforts in this direction are also crowned with good results, for at the exhibition held at Richmond on June 26, 1901, his firm secured a Gold Medal for a new Hybrid Perpetual Rose, named Ben Cant—a variety of splendid form, substance, and crimson colour; and again on July 4, 1901, at the N.R.S. Temple Show, a Gold Medal for the new seedling Tea, Mrs. B. R. Cant.

Many promising seedlings were seen at the Old Rose Gardens last summer, and one has every reason to predict a future of distinction for Mr. B. E. Cant as a raiser as well as exhibitor. He states in a letter to us that his great object is to secure hardiness and great vigour of growth in his seedlings.

### Mr. Hugh Dickson.

Mr. Hugh Dickson, of the Royal Nurseries, Belfast, has been connected with Rose growing since his earliest years, and served his apprenticeship in Edinburgh in the famous nurseries of Messrs. Lawson and Son, who were then amongst the leading Rose growers in Britain. Mr. Dickson returned to Belfast in the early fifties, and brought with him a choice collection of the finest Roses known at that date, also a number of Manetti stocks (the first introduced into Ireland), and thus became a pioneer in Irish Rose growing.

Mr. Hugh Dickson has been a leading exhibitor throughout Scotland and Ireland for the past forty years, and his success, which has continued so uninterrupted for so long a period, has made his name a household word among Rose growers in these countries. His recent successes in England, particularly under the National Rose Society in London, and the provinces, has also brought his name prominently before the Rose-growing public in England. His good fortune at English and Scottish shows is all the more meritorious considering the great distances the blooms have to travel. Mr. Hugh Dickson's nurseries are situated at Belmont, on the most beautiful suburbs of Belfast, and are amongst the most up-to-date in the country. Roses are, of course, the leading feature, and about 200,000 are grown and distributed annually. Coniferæ are also a leading feature of the nurseries, as well as ornamental trees and shrubs, which do admirably at Belmont, the climate of Ireland suiting them. The trees are all splendid in health and colour. The general nursery stock is large and well grown, covering about forty statute acres.

### Mr. J. Harkness.

The business of Messrs. Harkness and Sons, Rose growers, Bedale, Yorks, of which Mr. J. Harkness is the leading member, was founded in 1880, in connection with Mr. R. Harkness, who now successfully carries on a separate business at Hitchin, in Herts. Mr. J. Harkness has taken the keenest interest in all hardy flowers, and Roses especially, for over thirty years, during which period he has also been a noted exhibitor.

The late Queen's Jubilee year (1887) brought the firm of Harkness and Sons their first great success in Roses, for they then won both the National Rose Society's trophies and every class for seventy-two distinct varieties in which they contested during the Rose season of that year. In the years 1887, 1889, 1893, 1895, 1897, and 1901 the N.R.S. trophy was awarded to their flowers, and in 1887, 1888, 1889, 1890, 1893, 1895, 1896, 1898, and 1900 the N.R.S. Jubilee trophy was captured by the Bedale blooms, making fifteen successes in (open) trophy classes from 1887 to 1901.

On three occasions the firm was unable to compete through the lateness of the season, and were second (twice beaten by one point) several times. The past season being a phenomenally late one, especially for firms northward, the Messrs. Harkness and Sons were unable to cut exhibition flowers till well on in August. The firm's record in competitions with hardy herbaceous flowers is equally creditable, and is a silent testimony to the care and cultural attention bestowed on the stock at Bedale, where twenty-two acres are under use.

An interesting fact in connection with their exhibiting of Roses is that the start was made after reading a hint given in "The Rosarians' Year Book," edited by the Rev. H. H. D'Ombrian, to this effect: "that if any nurseryman planted 5,000 Roses solely for exhibition, he would be almost certain to win the championship." Mr. J. Harkness took the hint, with the results indicated in the foregoing lines.

ARTHUR W. PAUL, Waltham Cross.

**Mr. Arthur William Paul.**

Mr. Arthur William Paul has been associated with his father, Mr. William Paul, F.L.S., V.M.H., for the past twenty-five years in the conduct of the Royal Nurseries at Waltham Cross. Whilst thoroughly conversant with hardy trees and shrubs, fruit trees, and the other specialities of a hardy-plant nursery, and closely occupied with the management of a large and increasing general nursery business, Mr. A. W. Paul has devoted especial attention to Roses, for which the Waltham Cross Nurseries have always been famed. Some few years since he recognized that the limits of the public taste in that flower appeared to have been reached in regard to excessive size and regularity of bloom, as manifested at the exhibitions, he turned his attention to its development as a decorative flower for the garden, with the result that a large number of varieties, remarkable for their freedom and continuity of blooming and exquisite tints of colour, and whose names have now become household words to the horticulturist, have been either raised at Waltham Cross or introduced to public notice from these nurseries. The early exhibits of these varieties in masses of a kind by Messrs. Wm. Paul and Son were the precursors of the present classes for garden Roses, which are now so popular at all leading Rose exhibitions, and amongst the most attractive sorts may be mentioned *Coralina*, *Enchantress*, *Queen Mab*, *Sulphurea*, and others raised at Waltham Cross and *Papa Gontier*, *G. Nabonmand*, *General Schablikine*, *Grand Duc de Luxembourg*, *Gross an Teplitz*, which Mr. A. W. Paul was the means of introducing through his firm to general notice in this country from the Continent, where he was among the first to recognise their merits. Some valuable climbing Roses have also been raised and introduced from Waltham Cross during the same period, notably the *Waltham Climbers*, *Waltham Rambler*, *Climbing Belle Siebrecht*, and the new *Field Marshal*, lately figured in these columns, which was greatly admired whenever exhibited last season.

Mr. A. W. Paul is especially identified with the Rose as an autumn flower, and his lecture on this special phase of Rose culture at the Royal Horticultural Society's meeting in September last year was very favourably received.

**Mr. George Cooling.**

Mr. George Cooling is head of the firm of Messrs. Cooling & Sons, seed merchants and nurserymen, Bath, and has done great service in popularising the garden Roses, and thirty years ago he secured and catalogued varieties which were then almost lost. His firm exhibit collections of the best garden Roses at all the leading Rose shows during the season, and with very notable success. Mr. Geo. Cooling and his sons have given considerable attention to Hybrid Bourbons. In 1898 they gained the N.R.S.'s gold medal for Purity (H.B.) at the Crystal Palace Show.

**Mr. Arthur Turner.**

Mr. Arthur Turner (whose portrait appears) and his brother, Mr. Harry Turner, together manage the business known under the name of Charles Turner, The Royal Nurseries, Slough. Mr. Charles Turner, the father of Mr. Arthur and Mr. Harry, established these nursery grounds over fifty years ago, and "Turner's, of Slough," has had a notable distinction during all that period. The famous Turner's Crimson Rambler was sent out from here, and the history of that Rose was given in the *Journal of Horticulture* for July 25th. 1901. It has been one of the parents of a number of the splendid new Ramblers that have been certificated within a recent date. The firm of Mr. Charles Turner has cultivated Roses to a very large extent for the past forty years, both indoors and out, and their specimen pot Roses at the Temple Shows and other leading horticultural exhibitions have been excelled on very rare occasions.

**Mr. Frank Cant.**

Mr. Frank Cant, of the Braiswick Rose Gardens, Colechester, is one of our best known rosarians. He is one of the oldest members of the Executive and General Committees of the N.R.S., and as an exhibitor of early and late Roses he has gained a high-standing reputation. It was Mr. Frank Cant who first exhibited those fine exhibition blooms in boxes at the Royal Horticultural Society's shows at the March meetings some twelve years ago. He captured the champion trophy of the N.R.S. at the Crystal Palace in 1883 (his second attempt), and won it again in 1890, 1892, and 1894, and this memorable Coronation Year he has carried off quite a large number of medals, cups, and trophies—notably at Holland House, the Temple Gardens N.R.S. Show, where he not only won the champion trophy for the seventy-two exhibition Roses, but also the first prize in the largest class for garden Roses (thirty-six bunches). The same day he won the Gunnersbury Challenge Cup at Richmond.

Of new Roses, Mr. Cant has given us three—Mrs. Frank Cant, a delightful pink in colour, strong growing, free blooming, and exhibited by him in almost every winning stand; Muriel, a charming salmon pink, which will be heard of more in the future; and Lady Roberts, a delightful new Tea Rose; seen even so late as October 7, when he completed his exhibiting for this year by staging decorative Roses, for which he was rewarded by a gold medal of the R.H.S.

Mr. F. Cant has two sons, one of whom will shortly come into the business.

GEO. COOLING, Bath.

GEO. DICKSON, Newtownards.

ARTHUR TURNER, Slough.

FRANK CANT (Frank Cant & Co.).

J. HARKNESS, Bedale.

B. E. CANT (B. R. Cant & Sons).

HUGH DICKSON, Belfast.

## Societies.

### Royal Horticultural Society, Drill Hall, Nov. 18th.

Captain Holford's Orchid collection was the cynosure of Tuesday's meeting, and both Messrs. Wells and Co. and H. J. Jones had charming groups of Chrysanthemums, which we refer to on page 467. Veitch's Begonias, too, were exceedingly brilliant. A number of very excellent hybrid Orchids were certificated, and the finest subject under the Floral Committee's notice was *Jacobinia chrysostephana*.

At the afternoon meeting Mr. Cecil H. Hooper gave a lecture on "Spraying Fruit Trees and Packing Apples, as Practised in Canada." The attendance of visitors was very satisfactory, though the day was bitterly cold.

#### Floral Committee.

Messrs. Hill and Son, Barrowfield Nurseries, Lower Edmonston, contributed a collection of Platyceriums, including the grey-felted Veitchi, the lacinated and drooping Willincki, and also Grande, a perfect stag's-horn specimen. A dozen species were on view, and many of them were models of the very best culture.

Messrs. Cannell and Sons, Swanley, staged over a dozen massive specimens of *Begonia Gloire de Lorraine* and *Turnford Hall*, the latter almost as large. The plants were over 2ft high, and almost the same through, being smothered with richly coloured flowers.

A whole table was filled with Begonias from Messrs. J. Veitch and Sons, Limited, Chelsea, S.W., including *Agatha*, a dwarf form, closely resembling *Gloire de Lorraine*; and the following "winter flowering" sorts: *Winter Perfection*, a bright cerise-pink; *Ensign*, glowing carmine; *Mrs. Heal*, a true single, with large crimson-scarlet flowers; *Julius*, the deep rose-pink *Balsam-flowered* variety; and *John Heal*, after *Lorraine* type, but with larger blooms, of a crimson colour and paler centre. The whole batch of plants were a blaze of colour, and proved that they had had the best of cultural attention. Their contribution of *Jacobinia chrysostephana*, a novelty, with terminal heads of bright orange-apricot flowers above broadly oval leaves, was much admired.

Lady Tweedmouth, Brook House, Park Lane, exhibited *Malmaison Carnations Princess of Wales* and *Sir Chas. Freemantle*, the flowers being of immense size and rich colour.

From Messrs. W. Cutbush, Highgate, N., came tree Carnations *Mrs. T. Lawson*, *Mrs. S. J. Brooks*, *Melba*, a good deep pink; *Golden Beauty*, yellow, flaked crimson; *America*, scarlet; *Harry Fenn*, dark crimson; *Sir Hector Macdonald*, a rosy-flaked flower, with white ground, very large and fine; and *Gov. Roosevelt*, intense, deep crimson; *Duchess of Portland*, soft pink; and a new tree, *Viscount Kitchener*, crimson flaked over white, and very large, which received an Award of Merit.

Messrs. Barr and Sons, London, had pompon and single-flowered Chrysanthemums, *Schizostylis coccinea*, *Rosa lucida*, and four cases containing wax models of the newest leading *Daffodils* and *Narcissi*. These were a great source of interest.

G. Ferguson, Esq. (gardener, Mr. F. W. Smith), The Hollies, Weybridge, contributed a sweet collection of single Chrysanthemums, all of them named and well staged.

Messrs. W. Wood and Son, Wood Green, N., set up The Triumph combined watering-can and hand-spray—a useful article.

*Epiphyllum delicatum*, in flower, was shown by Messrs. W. Bull and Sons, 536, King's Road, Chelsea. The flowers are mauve-pink, tipped with white. The graceful *Eugenia myriophyllum* was also shown. Ed. Mawley, Esq., Rosebank, Berkhamstead, contributed a bright collection of Roses.

#### Orchids.

A number of very choice hybrid Orchids were forward. Messrs. Hugh Low and Co., Bush Hill Park, Middlesex, staged *Cypripedium insigne Sanderæ*, *C. Leeannum magnificum*, and *C. i. Harefield Hall* variety, a noble and beautiful flower, with pouch of light brown shade and petals the same, the huge dorsal sepal being yellow towards the base, broadly tipped, and edged white, and spotted with chocolate.

W. P. Burkenshaw, Esq. (gardener, Mr. Barker), The West Hill, Hessele, near Hull, produced the variety described above, *C. i. Harefield Hall* var., and a handsome form of *Lawrenceanum-Curtisi* cross—namely, *C. x. Gowerianum magnificum* Hessele variety, of large size and beautiful purple colour.

Messrs. J. Veitch and Sons, Limited, sent *Cypripedium insigne Sanderæ* (thirteen healthy plants in flower); *C. i. Harefield Hall* var.; *C. Actæas*; *C. Thalia*; and *Cattleya Portia*, with six flowers; *L.-c. Tiresias*, with ten flowers—a superb piece; *C. Mantini*; *Lælia Mrs. M. Gratrix*; *L.-c. Haroldiana superba*, one of the very sweetest and handsomest hybrids at the meeting. They also staged *Lælio-Cattleya Thorntoniana grandiflora* (*Lælia Digbyana* male, *Cattleya Gaskelliana* female), an Orchid of very handsome form and beautiful colour.

Norman C. Cookson, Esq. (gardener, Mr. H. J. Chapman), Oakwood, Wylam, set up a grouplet which included a plant of *Cypripedium insigne Sanderæ*, having eight perfect flowers—the finest piece perhaps in the country; also *C. Actæus Oakwood* var.; *C. insigne Harefield Hall* var.; *Cattleya labiata Oakwoodensis*; and other very choice Orchids.

Messrs. James Cypher and Sons, Cheltenham, filled a space of 15ft by 3ft with *Cypripediums*, *C. insigne Chantini*, *C. i. Sanderæ*, *C. i. montanum aureum*, *C. i. Ernesti*, *C. i. ornatum*, *C. Leeannum giganteum*, *C. Niobe*, *C. i. punctatum violaceum*, *C. i. Harefield Hall* var., and others were all well shown. Their new Orchid catalogue was also seen on the stage, and copies can be had from the firm. *C. Leeannum Bourtoni* is one of the best, and which must not be overlooked.

Captain Holford, C.I.E. (grower, Mr. H. Alexander), Westonbirt, Tetbury, Gloucester, furnished such a contribution of Orchids as perhaps has never been seen at any of these meetings from one private collection. He filled the entire length of a table (66ft by 4ft). There were here over 500 *Cypripedium* flowers—a *C. Leeannum giganteum*, with fourteen blooms; while in the centre of the table was poised a specimen *Cattleya Boweringiana*, bearing ten racemes, one of which had twenty-six flowers, while the ten represented a total of 196 flowers for this one plant. *Oncidium varicosum Rogersi*, backed up by a *Phylllostachys*, was shown in two masses, most effectively. Two plants of *Vanda cærulea* were responsible for ten handsome inflorescences; and among other specially noteworthy plants here were pieces of *Cypripedium insigne Sanderæ*, *C. i. Harefield Hall* var., *C. i. eitrina*, *C. x. Sir R. Buller*, *C. i. Dormani*, and *C. Spicerianum*.

Others who staged Orchids were Baron Schröder, F. Wellesley, Esq., J. E. Fowler, Esq., Dr. Mistens, Mr. H. A. Tracy, and Chas. Maron, Esq., Brunoy, France.

#### Fruit and Vegetables.

Messrs. John Peed and Son, West Norwood, London, S.E., contributed a large collection of clean, well-kept Apples. There were good dishes of *Wellington*, *Belle de Pontoise*, *Lord Derby*, *Lane's Prince Albert*, *Ribston Pippin*, *Mère de Ménage*, *Wealthy*, *Bismarck*, *Allington Pippin*, and *Peasgood's Nonesuch*.

Messrs. J. Veitch and Sons, Limited, sent up a group of culinary and ornamental Kale. Tall Curled Kale, Veitch's Exhibition, Chelsea Exquisite, Veitch's New Sprouting, and some variegated varieties were on view.

#### Certificates and Awards of Merit.

*Begonia Agatha compacta* (J. Veitch & Sons, Ltd.).—This, to many people, would seem to be a very dwarf and compact variety of *B. Gloire de Lorraine*. The parentage is given as *B. socotrana* (female) × *B. natalensis*. The above reference describes it. (Award of Merit.)

*Bulbophyllum Eriesoni* (Hon. Walter Rothschild).—The seven flowers shown in the specimen were arranged on a horizontal plane around the central stem. The dorsal sepal lies back on the stem and the other segments protrude in the opposite direction. Colour green, spotted brown, and lip brownish purple. (Botanical Certificate.)

*Calanthe triumphans* (N. C. Cookson, Esq.).—The colour is amaranth. (Award of Merit.)

*Carnation Viscount Kitchener* (W. Cutbush & Sons).—Flowers over 3in. across, finely built; petals smooth, slightly notched, flaked crimson over white ground. On tall strong stems. Non-splitter. A good Tree. (Award of Merit.)

*Cattleya x Vigeriana* (Chas. Maron, Brunoy, France).—Parentage *C. aurea* × *C. labiata flammea*. A very graceful flower over medium size, coloured a deep rich purple; the lip deeper coloured and velvety, and shaded with brown in the throat on each side of the column. (Award of Merit.)

*Chrysanthemum Belle of Weybridge* (Mr. E. Ferguson, Weybridge).—A handsome single; colour, rich crimson, with orange disc. The fringe of ray petals is half an inch deep. (Award of Merit.)

*Chrysanthemum F. S. Vallis*.—A huge Jap. with recurving smooth florets of a soft sulphury yellow. Large, full and deep. An improved G. J. Warren. (Award of Merit.)

*Chrysanthemum Leila Filkins* (Wells & Co., Ltd.).—A very full rounded Jap. of silvery rose-mauve colour. A very beautiful and meritorious flower of Mrs. T. W. Pockett. (Award of Merit.)

*Chrysanthemum Miss E. Seward* (Mr. W. Seward, Hanwell).—A rich intense golden yellow incurved, shaded bronzy-red. (Award of Merit.)

*Crab, Langley Crab* (J. Veitch & Sons, Ltd.).—A hybrid: *John Downie Crab* × *Apple King of the Pippins*. Shape ovate, apex rather pointed; small. Colour deep-bronze. (Award of Merit.)

*Lælio-Cattleya x Clive var. Sanderæ*.—Parentage, *Lælia pumila alba* × *Cattleya aurea*. A close built flower with broad segments, particularly the petals. These are ivory white flushed lilac. Lip opened at front deep amaranth-purple, the edge folded over the column forming a rosy-lilac tube. (Award of Merit.)

*Lælio-Cattleya Statteriana superba* (J. Veitch & Sons, Ltd.).—Parentage, *Cattleya labiata* × *Lælia Perrini*. A deep mauve-purple colour on petals and segments, with exceedingly rich dark maroon-purple velvety lip, have a white halo in the centre of the tube below, and in front of the column. (Award of Merit.)

*Lælio-Cattleya* × *Thorntoni grandiflora* (J. Veitch & Sons, Ltd.).—Parentage, *Lælia Digbyana* × *Cattleya Gaskelliana*. Perhaps the finest of the Digbyana type of hybrids. The flower is large and of a better form than L.-c. King Edward. The lip is large and finely fringed, coloured a soft yet distinctive mauve with a shade of pink in it. The throat is bright green somewhat shaded with a yellow tint, but green prevails. This is certain to be one of the choicest bigeners for a very long while to come. (First-class Certificate.)

*Jacobinia chrysostephana* (J. Veitch & Sons, Ltd.).—A Mexican species of great horticultural excellence. The stems are quite straight and erect, the leaves placed oppositely with oval-acuminate leaves 6in. long and 3in. broad and prominent ribs. The bright orange-apricot heads of tubular flowers are borne in large clusters terminally. (First-class Certificate.)

#### Medals (Official List).

**FLORAL COMMITTEE.**—Silver-gilt Flora, for a group of Platyceriums, to Messrs. J. Hill and Son, Lower Edmonton; for a group of Chrysanthemums, to Wells and Co., Limited, Earlswood, Redhill, Surrey. Silver-gilt Banksian, for a group of winter-flowering Begonias, to Veitch and Co., Limited, Chelsea, S.W.; for Chrysanthemums, to Mr. H. J. Jones, Lewisham, S.E. Silver Banksian, for Begonias and Chrysanthemums, to Messrs. Cannell and Son, Swanley.

**ORCHID COMMITTEE.**—Large Gold Medal, for a group of Orchids, to Capt. Holford, C.I.E., Tetbury, Glos. Silver Banksian, for a group of Orchids, to N. C. Cookson, Esq., Wylam-on-Tyne. Silver Flora, for a group of Orchids, to J. Veitch and Sons, Limited, Chelsea, S.W. Silver-gilt Flora, for a group of Orchids, to J. Cypher and Sons, Cheltenham. Vote of thanks, for a group of Orchids, to W. P. Burkinshaw, Hessle, near Hull.

Cultural Commendations were awarded to Mr. H. Alexander, Orchid grower to Capt. Holford, for a plant of *Cattleya Bowerlingiana* and *Cypripedium Leeanum giganteum*.

### Bolton Horticultural and Chrysanthemum, Nov. 7th and 8th.

For the fourteenth year the Albert Hall, Bolton, has been requisitioned for the annual Chrysanthemum Show at Bolton, and an excellent display was housed therein on the dates given. The amateurs once again deserved the heartiest encouragement and commendation. Both in floriculture and in vegetables they showed how they can succeed under difficulties in obtaining really excellent results. There were, in addition to the competing exhibits, several collections shown by famous growers, amongst the principal being stands of blooms from Mr. Norman Davis, Uckfield, Sussex, and Messrs. Wells and Co., Surrey; and in Violets Messrs. House and Son, Westbury, showed delightful specimens, including the Princess of Wales and Queen Charlotte.

The society, of which Mr. W. H. Lever is president, Mr. Richard Smith chairman, Mr. H. Shone treasurer, and Mr. H. Makin secretary, offered £130 in prizes, and also four silver cups. The judges (who had a stiff task through the keenness of competition) were Messrs. Elkin (Eccles), C. Osborne (Aigburth), Hathaway (Parks Superintendent, Southport), and Ranger (Liverpool).

The principal prizewinners were J. W. Makant, Esq. (gardener, Mr. H. Shone), Gilnow Lodge; E. T. Crook, Esq. (gardener, Mr. J. Wainwright), Cleveland; J. Heywood, Esq., J.P. (gardener, Mr. G. Pawson), The Pike; E. Ellis, Esq. (gardener, Mr. J. Davies); W. Holland, Esq. (gardener, Mr. W. Barber), of Liverpool; E. Evans, Esq. (gardener, Mr. C. Jones), Old Hall, Cheshire.

### Devizes, November 11th.

The Devizes Benevolent Society avails itself of the Chrysanthemum season to hold an exhibition in the Corn Exchange in conjunction with a bazaar, which is managed by the ladies of Devizes, for the benefit of the above society. Mr. A. J. Randall, Exchange Place, acts as secretary, and Mr. W. King has succeeded his late father as the manager of the show. The best circular group of Chrysanthemums came from Col. C. E. Colston, M.P., Roundway Park, Devizes (Mr. H. Clack, gardener), and Miss Nevill, The Grange, Morden, was second.

The leading class was for twenty-four blooms of Japanese and twenty-four incurved, and there were five exhibitors, Mr. W. Higgs, gardener to J. B. Hankey, Esq., Fetcham Park, Leatherhead, taking the first prize with well developed Japs and highly finished incurveds, having a set of the newer varieties. Mr. G. W. Drake, Cathys Terrace, Cardiff, was a close and remarkably good second; and third, Mr. G. Hall, gardener to Lady Louisa Ashburton, Romsey, Hants. An extra prize was awarded to Mr. J. Bible, The Gardens, Draycot Park, Chippenham.

In the class for twenty-four Japs there were several entries, the first prize being a handsome silver cup, given by the Mayor of Devizes. This was won by Mr. F. S. Vallis, Bromham Fruit Farm, Chippenham, who had very fine blooms indeed. Second, Mr. Geo. Hall, who had in fine character Mrs. H. Weeks, Nellie Pockett, Mrs. Greenfield, Sir H. Kitchener, Calvat's '99, Lord Ludlow, Lord Salisbury, E. Molyneux, Mrs. Mease, Matthew

Smith, Calvat's Sun, Marquis V. Venosta, &c.. Mr. J. Bible was third. Class 4 was for twelve Japanese incurved, Mr. F. S. Vallis again coming in first. His leading blooms were C. J. Salter, Mr. T. Carrington, Calvat's '99, W. R. Church, Ethel Fitzroy, Nellie Pockett, &c. Mr. G. W. Drake was placed second, and Mr. J. Bible was third. With twelve blooms, six white and six yellow, Mr. F. S. Vallis again came in first; Mr. Bible came second, and Mr. H. Clack was third. In the class for twelve blooms of Japanese, not less than six varieties, Mr. Vallis was again first, showing, in fine character, Mrs. J. Lewis, F. S. Vallis, Lord Salisbury, &c. Mr. H. Clack came second, his best blooms were W. R. Church, Lord Ludlow, Lady Hanham, Madame G. Henry, &c. Mr. J. Bible was again third.

### Oxford, November 11th.

The fortieth annual show of Chrysanthemums, fruits and vegetables was held in the Town Hall on Tuesday, November 11. The show was far the best that has been held for years. The entries were numerous and the competition keen. For Chrysanthemum groups Mr. H. Sheppard was first and Mr. F. W. Ogilvie second. For group of autumn flowering and foliage plants, Mr. F. W. Ogilvie was first and Mr. W. T. Mattock second. For six single Primulas: First, Mr. G. Palmer; second, Mrs. Greswell; third, Mr. G. Jacob. Six winter flowering Begonias: First, Mr. G. W. Bennett; second, Mr. W. T. Mattock. For cut blooms, twenty-four incurved Chrysanthemums: First, Mr. H. O. Lovel; second, Mr. S. Brown; third, Mr. G. L. Burgess. Twelve ditto: First, Mr. V. Watney; second, Mr. G. W. Bennett; third, Mr. F. Belcher.

Twelve incurved, one variety: First, Mr. G. W. Bennett; second, Mr. J. L. Burgess; third, Mr. J. Tranter. Twelve large Anemones: First, Mr. G. Burgess; second, Mrs. Bradshaw. Twenty-four Japanese, distinct: First, Mr. S. Brown; second, Mr. G. W. Bennett; third, Mr. G. Ravenor. Twelve Japanese, distinct: First, Mr. W. T. Felton; second, Mr. V. Watney; third, Mr. F. Belcher. Nine Japanese, distinct: First, Mr. S. Mold; second, Mr. J. L. Burgess. Six Japanese, one variety: First, Mrs. Dere; second, Mr. J. W. Bennett; third, Mr. G. Ravenor. Six Japanese, one variety (yellow): First, Mr. J. R. Tranter; second, Mr. G. W. Bennett; third, Mr. W. Felton.

Nine varieties in triplets in vases, Japanese or incurved: First and cup, Mr. G. W. Bennett; second, G. H. Marvell, Esq., M.P.; third, Mr. H. O. Lord. Twelve pompons, distinct: First, Mrs. Inge; second, Mr. J. L. Burgess. Nine pompons, distinct: First, Mr. G. L. Burgess.

Table decorations: First, Mr. G. Jacob; second, Mr. John Mattock; third, Mr. T. W. Mattock. Seven dishes of Apples: First, Mr. H. Smart; second, Mr. John Mattock. Twelve dishes of Apples (six dessert and six culinary): First, Mr. A. Harcourt; second, Mr. R. Price; third, Mr. H. Smart. Six dishes of Apples (three dessert and three culinary): First, Mr. W. T. Mattock; second, Mr. G. W. Bennett; third, Mr. H. Kent. Apples, one dish Blenheim Pippin: First, Mr. A. Harcourt; second, Mr. W. Plaister; third, Mr. W. T. Mattock. Six dishes of Pears: First, Mr. H. Smart; second, Mr. A. Harcourt; third, Mrs. Inge. Three dishes of Pears: First, Mr. W. Hazell; second, Dr. Neil; third, Mr. G. Mopp. Two bunches of white Grapes: First, Mr. S. Brown; second, G. H. Marvell, Esq., M.P. Two bunches of black Grapes: First, Mr. S. Brown; second, G. H. Marvell, Esq., M.P.

There was room for great improvement in the Grape classes, but the Apples and Pears were exceedingly good. Nine dishes of vegetables, distinct kinds: First, Mrs. Bradshaw; second, Mrs. Inge; third, Mr. A. Harcourt. Six dishes of vegetables, distinct kinds: First, Mr. G. Perrin; second, Mr. J. E. Tayler; third, Mr. M. J. Griffin. Three dishes, distinct kinds: First, Mr. J. Tanner; second, Mr. E. W. Reynolds; third, Mr. G. T. Phipps.

Nine Onions: First, Mr. W. H. Dove; second, Mr. J. C. Tayler; third, Mr. G. Perrin. Nine Onions: First, Mr. J. Step-toe; second, Mr. G. T. Phipps; third, Mr. H. Kent. The vegetables were very good, but taste in staging was wanting. The judge of Chrysanthemums was Mr. W. G. Drover, who expressed a high opinion of the groups and the show in general. Messrs. Nichols and Brown judged the fruit and vegetables. The attendance was very large, and the arrangements reflect great credit on the organising abilities of the veteran secretary, Mr. W. Greenaway.

### Ipswich and East of England Horticultural.

The autumn exhibition of the above society was held in the Public Hall on the 11th and 12th inst., the attractions of the floral feast being considerably increased by the performances of the Royal Hungarian Ladies' Band. Generally speaking, the exhibits in all departments were up to the average both in quantity and quality.

The Japanese blooms staged were in most cases large, solid, and of good colour, but occasionally lacked freshness. The incurved section was barely represented at this show. Several

classes are provided by the society for blooms in vases, both for large blooms and decorative kinds, which does much to relieve the monotony generally apparent in Chrysanthemum exhibitions; but the committee might advantageously pay more attention to arranging the vases so as to produce a better general effect.

**CUT FLOWERS.**—In the premier classes for twenty-four Japanese Mr. G. H. Smart, gardener to W. R. Seago, Esq., Oulton Hall, Lowestoft, was placed first, with a good stand, which included excellent flowers of Princess Alice de Monaco, J. R. Upton, Mafeking Hero, Attraction, Madame G. Henry, Madame P. Radaelli, and Lord Ludlow. Mr. A. Haynes, gardener to Colonel Browning, C.B., Brantham Court, Manningtree, was second, having Calvat's 99 and Mrs. J. Bryant, in good condition.

For twelve Japs there was a strong competition, the first prize going to Mr. A. Creek, gardener to Sir C. Donville, Bart., The Chantry, Ipswich, for an excellent stand, the best blooms being Mrs. Mease, W. R. Church (Silver Medal N.C.S. for best bloom in open classes), Mons. Hoste, Pride of Exmouth, Alice Byron, and Mrs. Barkley. Mr. A. Haynes was second with a good stand, and Mr. Smart third. For six of any white variety, Mr. W. Bullam, Mutton Hall, Wetherden, scored with Madame Phillippe Rivoire; Mr. Heath, Hamilton House, Newmarket, coming second with Nellie Pockett. In the corresponding class for any other colour Mr. A. Creek was first with Phœbus, Mr. Haynes second with Australie.

The class for six vases, five blooms of each variety, brought four competitors. Mr. Smart was awarded first, having good sets of Lord Ludlow, Madame Phillippe Rivoire, Mr. T. Carrington, and Kimberley; Mr. Haynes came second, his best being The Princess, Mrs. Barkley, and Vivian Morel; Mr. Heath third.

Much attention was attracted by the class for six blooms arranged for effect with any foliage, the exhibits thoroughly demonstrating the adaptability of large flowers for decoration. Mr. Messenger, Woolverstone Park Gardens, was awarded first for some massive blooms of white and yellow varieties, charmingly arranged with the foliage of the scarlet Oak, Brake, and Asparagus Sprengeri. Mr. Creek was second for an arrangement of yellow and bronze varieties with similar foliage.

Groups are never a strong feature at Ipswich, and on the present occasion were only moderate. For a group of Chrysanthemums with foliage plant Mr. R. C. Notcutt, Broughton Road Nursery, Ipswich, was first; Mr. Strutt, gardener to W. P. Burton, Esq., second; and Mr. Southgate, St. Helen's Nurseries, Ipswich, third. The foregoing exhibitions occupied the same order for a group of miscellaneous plants.

Fruit and vegetables were of good quality (with the exception of Grapes), and competition was keen. The principal prize-winners were Messrs. J. Lindsay, Scott, Messenger, Kettle, Sweet, Trewer Bros., Stowmarket, Andrews, &c.

Mr. R. C. Notcutt, The Nursery, Woodbridge, showed a representative collection of Apples, not for competition, and, likewise, a large collection of Cactus Dahlias, the latter certainly an uncommon feature at a Chrysanthemum show, and a striking proof of the mildness of the season.—E. C.

### Birmingham Chrysanthemum, Nov. 11, 12, and 13.

The forty-second annual exhibition was held in the Bingley Hall on the above dates. As regards the quality of the exhibits, as a whole, it was on a par with that of any previous event. Regarding the groups for effect, it was a matter of regret to observe at least a numerical falling away of this ever attractive class. The foregoing refers to class 9, where the group was to be arranged in a space 20ft wide at back by 12ft deep. Upon this occasion there were but two exhibits, otherwise Mr. Oliver Brasier (a former old exhibitor) was debarred competing at all, by reason, as a matter of prudential delicacy, of his employer (Mr. E. Martineau) being president. As usual, however, he exhibited a superlatively excellent group of specimen plants of Chrysanthemums, and other plants and flowers, not for competition; hence, leaving the competitive honours to Mr. W. Thomson, gardener to J. W. Whitfield, Esq., Moseley, and Mr. Alfred Cryer, gardener to J. A. Kenrick, Esq., Edgbaston, who won as in order named with highly creditable displays. For a group in a space 12ft by 8ft, there were five exhibits, the successful winner being Mr. J. Maldrem, gardener to Geo. Cadbury, Esq., Northfield; Mr. C. Kelland, gardener to A. H. Griffiths, Esq., Edgbaston; Mr. H. Davis, gardener to F. Mantle, Esq., Beechlands; and Mr. S. Coster, gardener to Mrs. T. H. Smith, Handsworth, placed so. On the whole there was to be observed a more than usually good display in quality of blooms and taste in arrangement throughout.

The Birmingham specimen Chrysanthemum plants have long been noted for their excellence, but they were hardly so good this year. In the class for nine plants (Japanese excluded), Mr. J. Maldrem was to the fore as the only exhibitor. For six large flowering plants, Mr. Maldrem won against his formidable rival, Mr. A. Cryer; third, Mr. C. S. Sheppard, gardener to Mrs. T. Simpson, Edgbaston.

Special mention must be made of Mr. James Austin's group of Chrysanthemums from Alder Road, Sparkbrook, a brasswork operative (and whose fine group of Chrysanthemums of last year were figured in the Journal of October 16 last). Apart from the excellence of the group in question, it was rendered additionally interesting to a numerous lot of admirers as being the product of a mechanic who works at the rate of fifty-four hours a week, two miles from his home. Mr. Austin, too, exhibited on the front of his group a copy of the *Journal of Horticulture*, for visitors to note the photogravure, for the two remaining days of the show. At the judges' luncheon the president of the society paid a high compliment, in the course of his speech, to Mr. Austin's ability and effective group; and a similar compliment was accorded Mrs. E. Pitt, florist, Acock's Green, in recognition of her artistically arranged dinner-table floral display of Source d'Or Chrysanthemums, defeating the remaining nineteen competitors in a very keen contest, the greatest yet produced at the Birmingham exhibitions.

In the honorary exhibits, Messrs. Perkins and Sons, Coventry, added to their fame by exhibiting one of the largest and best of their artistic floral "concoctions" yet contributed by them, and a cunningly devised floral "grandfather's clock," with a real "Greenwich time" clock, and the figures composed of Holly berries. Messrs. Lohrmann and Co., florists, Birmingham, also contributed a large and grand display of bouquets and other floral devices, though it left considerable room for improvement, as numbers of the exhibits were too much hidden by the bolder ones. Messrs. Perkins were placed first (in the class for nurserymen only) for a hand bouquet, whilst Messrs. John Pope and Sons were second; Mr. W. Finch, Coventry, was placed third. It should here be remarked that Messrs. Pope and Sons also contributed a very attractive floral device in the shape of a large gate composed of white Chrysanthemums, arched with autumn-tinted foliage.

Mr. H. Whately, Kenilworth, were responsible for a fine and large display of Orchids. Mr. Thomson, of Sparkhill, had a very striking trophy of plants in variety, the principal feature being the large mass of *Salvia splendens superba*.

Mr. Walter Child, nurseryman, Acock's Green, distinguished himself by a large collection of herbaceous and Alpine plants, flowering and berried dwarf plants, suitable for the rockery, most effectively arranged.

Mr. R. Greenfield, jun., Leamington, put up a fine lot of his newly-introduced *Asparagus myriocladus*. Messrs. Webb and Sons, Stourbridge, as usual, made a fine and representative display of vegetables, *Begonia Gloire de Lorraine*, *Cyclamens*, &c. Messrs. R. Smith and Co., Worcester, had a very fine collection of Apples, Pears, and vegetables. Messrs. Hewitt and Co., Birmingham, were distinguished by a fine arrangement of plants in variety.

Messrs. John Peed and Son, West Norwood, sent a remarkably fine and highly creditable collection of Apples and Pears. Messrs. W. Wells and Co., Earlswood, Surrey, sent a large assortment of seedling and other cut Chrysanthemums. Messrs. House and Son, Westbury, staged a fine collection of Violets, of blue, white, and sulphur hues.

Messrs. Clibran, Manchester, were represented by a splendid group of *Celosias* and Chrysanthemums in variety. The King's Acre Nurseries Company, Limited, Hereford, had one of their notable displays of Apples and Pears. Mr. H. Deverill, Bankway, contributed a striking display of *Pelargoniums* in bunches; Mr. Pewtress, Hereford, had an extraordinary fine display of Apples; Mr. Hamill, of the Vineries Company, Limited, Acock's Green, had an attractive group of Chrysanthemums; and Mr. Udale's (Droitwich) collection of vegetables, grown under the influence of animal and chemical manures, experimentally, of which further reference may be made at an early date. A large assortment of dried fruits were included in this economic contribution.

Considering the very considerable effectiveness rendered to the exhibition by the non-competitive trade growers, we deem it but just in having so far drawn special attention to them, comparatively brief though the descriptive notes are, and the committee signified their appreciation of the contributions by awarding medals and special certificates at the discretion of the judges.

Vegetables formed a feature of the show, and for quality were never excelled. Space will not allow of a detailed list of the whole of the prizes awarded. The principal awards were for the collections of nine kinds, and Mr. E. Beckett (gardener to Lord Aldenham, Elstree) led, and Mr. A. G. Gentle (gardener to Mrs. Dennison), Berkhamstead, second. The liberal special prizes offered by the trade—such as by Messrs. Sutton and Sons, Reading; R. Smith and Co., Worcester; Webb and Sons, Stourbridge; and Pope and Sons, Simpson and Sons, Thomson and Co., all of Birmingham—were liberally responded to; whilst Mr. R. Sydenham's numerous prizes were also potent in effecting a strong competitor. His open silver challenge bowl was awarded to Mr. H. Folkes, gardener to the Right Hon. T. F. Halsey,

Hemel Hempstead, with 47 points out of a possible 60. Mr. Sydenham's local challenge vase was won by Mr. J. R. Waters, Sheldon, with 50 out of 60 points, second year outright.

As the vase blooms have already been briefly noticed, it must suffice to remark that the exhibits contained the best varieties extant, and that the successful contestants were Mr. E. J. Brooks, gardener to Colonel C. Beech, Coventry, first, with grand blooms; second, Mr. J. Risk, gardener to J. H. Hadfield, Esq., Ross; and third, Mr. J. H. Goodacre.

For six Japanese blooms, distinct, Mr. T. Pritchard was placed first, and Mr. J. Jennings, gardener to Leopold de Rothschild, Esq., Ascott, second. Both exhibits contained grand creations of bloom.

In the class for eighteen blooms of incurved varieties, Mr. R. Jones, Barford, Warwick, was the only exhibitor. We may here observe that in the above exhibit, also of others, the leading varieties extant were on view, and it would be superfluous to append the names. In the class for eighteen Japs, Mr. E. J. Brooks, Mr. J. Risk, and Mr. R. Jones were the leading winners as named. For twelve incurveds, Mr. J. V. Macdonald, Edgbaston, led; and second, Mr. C. Batchelor, Edgbaston. For twelve incurveds, Mr. R. Jones was placed first; the second prize was not awarded; and third, Mr. W. Manning, of Dudley. For six white Japs, Mr. J. Jennings, Mr. C. Batchelor, and Mr. H. Woolman, Acock's Green, were the respective winners. For six blooms of any one variety of yellow Japanese, Mr. Neal, Bampton, led the way; second, Mr. C. L. Branson, Coleshill. For twelve blooms Japanese with foliage, Mr. J. V. Macdonald was first. In the remaining few local classes there was also a very good competition.

Primulas were unusually well staged, and the first prize exhibits in the various classes reflected great credit on Mr. C. H. Herbert (Messrs. Thomson and Co.'s expert grower). The same remark applies to Mr. A. Cryer; Messrs. Pope and Sons; Mr. R. Dixon, gardener to Viscount Cobham, Hagley Hall, Stourbridge; and Mr. R. G. Rudd, gardener to R. C. Cartwright, Esq., King's Norton. Contributions in the classes for Primulas and Cyclamens were highly meritorious.

The fruit classes were not so numerously represented as on the last occasion, more regarding to Apples and Pears. For a collection of British-grown fruit, Mr. G. Mullins, gardener to Lady Henry Somerset, trotted in with very good bunches of black and white Grapes, Melons, Apples, and Pears; second, Mr. H. Weeks, Derby, with a smaller collection; and third, Mr. J. Read, with Grapes, Apples, and Pears. Grapes were more remarkable for quality than quantity. In the class for six bunches, not less than three varieties, open, Mr. G. Mullins was the victor; second, Mr. J. Jones; and third, Mr. J. Lockhart. For three bunches of black Grapes, Mr. Mullins again secured first honours, with perfectly finished bunches of Gros Colman; Mr. J. Jones, gardener to Mrs. Needham, Malvern, second; and third, Mr. J. Lockhart, Warrington. For three bunches of white Grapes, Mr. J. H. Goodacre went to the front. For two bunches of white Grapes, Mr. H. Folkes was the solitary exhibitor. For two bunches of black Grapes, grown within four miles of Stephenson's Place, Birmingham, Mr. C. Kelland, Mr. A. Cryer, and Mr. R. Sheppy, gardener to T. W. Petersen, Esq., were the respective winners. For two bunches white Grapes, Mr. C. Kelland, gardener to A. H. Griffiths, Esq., Edgbaston, and Mr. R. Sheppy scored with very good Muscat of Alexandria.

### Reading Chrysanthemum, November 12th.

A large show—filling the Old and the New Town Hall—of general high quality, and a record attendance, were the leading characteristics of this annual exhibition. The fifty-seven classes in the schedule of prizes were generally well filled, and the judges were set a heavy task. The Reading Society Challenge Cup, offered for the best group of disbudded plants grown in pots was won for the third time by Chas. E. Keyser, Esq., Aldermaston Court (Mr. Galt, gardener), with an extremely fine display, arranged as a circle, and Mr. Galt is to be congratulated on his third successive win. Mr. W. B. Monck, Reading (Mr. Docker, gardener), was second.

Specimen plants were poorly shown if we except the two trained specimens set up by Mr. Booker; they were Vivian Morel and Val d'Andorre. Mr. Booker was also first with two single-flowered and two pompons.

The cut flower classes were generally well filled. The best twenty-four incurved blooms came from Mr. J. B. Hankey, Fetcham Park (W. Higgs, gardener), a well-finished, level collection of blooms which contained fine examples of Hanwell Glory, Duchess of Fife, Pearl Palace, Thos. Lockie, Charles Curtis, Globe d'Or, Mrs. F. Judson (the new white incurved), Countess of Warwick, Ma Perfection, Mrs. H. J. Jones, J. Agate, &c. Mr. Bible, The Gardens, Draycot Park, Chippenham, was second, having varieties in the main similar to those named. Mr. W. L. Bastin, Buscot Park Gardens, was third.

With twenty-four Japanese Mr. Higgs was again first; Mr. Nicholl, The Gardens, Strathefieldsaye, was a good second; and

Mr. Bible third, and so good was the competition that two extra prizes were awarded. With twelve incurved, Mr. Page, The Gardens, Dropmore, came first with good blooms, and Mr. G. W. Bennett was second. Mr. Galt was a good first with twelve Japs, Mr. Page coming second, and Mr. Bastin third.

A class for six vases of Chrysanthemums, three blooms in a vase, brought a brisk competition. Mr. Barnes, The Gardens, Bearwood, Wokingham, was placed first with well-developed blooms, Mr. Nichols being a close second, and Mr. Cole third. With twelve bunches of singles, Mr. Leonard Sutton was placed first with fresh bright flowers of good quality; Mr. R. Hewett was second.

With six blooms of Japs, one variety, Mr. Galt came first with fine flowers of W. R. Church, Mr. Nichols was close up with Mrs. G. Mileham, and Mr. Bennett third with Vicar of Leatherhead. With six incurved, one variety, Mr. Higgs came first with excellent Charles Curtis, Mr. Bastin came second with Duchess of Fife, and Mr. Galt third with Lady Isobel. Vases of six blooms of one variety of Jap made a fine feature. Mr. Nichols came in first with R. H. Pearson, very fine; Mr. Cole coming second with W. R. Church, the competition being very close indeed.

There were several classes for plants. Berried subjects were those of hybrid Solanums. Groups of zonal Pelargoniums filling an allotted space made a bright feature. Good Orchids were shown in threes by Messrs. J. B. Taylor and P. H. Evans, Pangbourne. There were Poinsettias, plants for table decoration, fine Palms, handsome Kentias predominating, charming Cyclamens, shown in sixes, Begonia Gloire de Lorraine. Messrs. Bible and M. H. F. Sutton having remarkably well-grown and flowered examples, and there was also groups of Chrysanthemums shown by single-handed gardeners. Cut Roses shown in two classes were a pretty feature. There were several classes for Grapes, Apples, and Pears. The chief prizewinners here were Mr. Cole, Swallow Park; Mr. Barlow, Balmore; Mr. Exler, Easthorpe; Mr. M. H. F. Sutton; Mr. Galt; Mr. J. B. Taylor; Mr. Nichols; Mr. C. W. Caddock, Ross, Hereford; Mr. R. Webb, Beenham; Mr. C. O. Walter, Wantage; and Mr. Page, Dropmore.

Of miscellaneous exhibits there were plants of Begonias Gloire de Lorraine and Turnford Hall from Mr. Herbert Sutton; bottled and evaporated fruits from the Lady Warwick Hostel, Reading; and a large bank of various designs in floral decoration—all of a high order of merit—from Mr. Phippen, Court florist, Reading.

### Banbury, Nov. 12th and 13th.

The annual Chrysanthemum show was held in the Town Hall on Wednesday and Thursday, November 12 and 13. The entries were more than last year, and the competition was much keener. The two days were fine, and there was a record attendance. The judges were Messrs. W. Drover and E. Beckett. The chief prizewinners were as follows:—For thirty-six Japanese blooms: First, Mr. F. J. Myers (gardener, Mr. J. M. Bush); second, Mr. G. Williams (gardener, Mr. G. Gerrish); third, Lord Algernon Gordon-Lennox (gardener, Mr. S. Low). Twelve blooms arranged with foliage, first, Mr. W. C. Cartwright (gardener, Mr. S. Brown); second, Mr. Myers; third, Mr. W. H. Foster-Melliar (gardener, Mr. J. Swain). Eighteen blooms: First, Mr. W. C. Cartwright; second, Mr. A. R. Motion (gardener, Mr. T. G. Flanders); third, Mr. J. G. Ravenor. Twelve blooms: First, Mr. W. T. Felton; second, Mr. T. M. L. Cartwright (gardener, Mr. G. Stocklev); third, Mr. J. Allen (gardener, Mr. G. A. Haynes). Six blooms, white: First, Mrs. Deare (gardener, Mr. T. Robinson); second, Mr. A. R. Motion; third, Mr. Ravenor. Six blooms other than white: First, Mr. Myers; second, Mr. Ravenor; third, Mr. W. C. Cartwright. Twelve incurveds: First, Mr. W. C. Cartwright; second, Mr. Smith-Ryland; third, Mr. J. L. Burgess. Six incurved: First, Mr. J. G. Williams; second, Mr. Motion; third, Mr. Smith-Ryland. Twelve reflexed: First, Mr. J. L. Burgess; second, Mr. Foster-Melliar; third, Captain Cottrell-Dormer (gardener, Mr. H. Wingrove). Twelve Anemones: First, Mr. Foster-Melliar; second, Captain Cottrell-Dormer; third, Mr. J. L. Burgess. Twelve bunches of pompons (not Anemones): First, Mr. J. L. Burgess; second, Mr. Foster-Melliar; third, Captain Cottrell-Dormer. Six ditto: First, Miss Gillet; second, Captain Cottrell-Dormer. In the bouquets and sprays Messrs. Perry and F. Tyrrell took the leading prizes.

For Begonias: First, Mr. Motion. Primulas: First, Mr. Motion. Cyclamen: First, Mr. Foster-Melliar.

The leading prizewinners in the fruit classes were Messrs. Walter, Williams, Wadham, Belcher, Cartwright, Holland, Wells, Perks, and Captain Cottrell-Dormer. In the vegetable classes the competition was keen and the produce good. For Potatoes Messrs. Wells, Taylor, Wadham, and Tooley were the chief winners. For Onions (twelve): First, Mr. Dunnell; second, Mr. S. Taylor; third, Mr. Perks, M.P. For collection of vegetables: First, Mr. R. Wadham; second, Captain Cottrell-Dormer; third,

Mr. S. Taylor. Tomatoes: First, Mr. Perks, M.P.; second, Mr. H. Boxold; third, Capt. Cottrell-Dormer. The non-competitive exhibits were from Messrs. Perey, Clow, Townsend, and Colchester.

The duties of secretary have been carried out ably for many years by Mr. W. H. Walkley. Mr. Walkley has been elected Mayor of Banbury, an office which he will no doubt ably fill.—S. H.

### Hull, November 12th and 13th.

The annual show was held in the Artillery Barracks, and like many held this season, suffered a little in point of quality as well as in numbers. The management here, who are always on the look-out for new features of interest for the benefit of their patrons, instituted an entirely new class—that for two pillar groups, each on a ground space 6ft by 4ft, a mirror panel group on a ground space of 9 square feet, and a hanging basket; the pillars 15ft high. The whole to be decorated with Chrysanthemums and miscellaneous plants (except Orchids). Four competed, making an interesting display. Mr. V. Waterhouse, gardener to W. T. Owbridge, Esq., The Grange, Cottingham, secured the premier award of a silver cup and £7 for a bold yet effective display. Although wanting a little in detail arrangement, a trifle too much cork and dull-coloured moss was to be seen. Large-flowered Japanese Chrysanthemums made a capital display, associated as they were with suitable foliage plants. The hanging basket contained a magnificent plant of *Asparagus Sprengeri*. The second prize group, from Mr. G. Coates, gardener to S. L. Haldane, Esq., 114, Coltman Street, Hull, was more artistically arranged, but was lacking in boldness. The tall pillars were too sparsely flowered, showing a trifle too much greenery; still, it was an exceedingly close second. The mirror was charmingly decorated. Mr. J. Foster, jun., "Swiddy's," Newland, third, with Messrs. Tattersall and Judson, East Park Nurseries, Hull, fourth.

Three competed in a class for a group of miscellaneous plants arranged for effect in 100 square feet. Mr. J. Foster, jun., secured the leading award for an arrangement a trifle crowded in the centre, yet containing many handsome Chrysanthemums, foliage plants, and Orchids, all tastefully blended together. Mr. T. M. Peteh, gardener to Mrs. Bennington, Mona House, Sutton, second with an arrangement a trifle "thin."

Chrysanthemums in pots exhibited somewhat the result of a backward season. What are known here as "cut backs," to induce dwarfness with good foliage and flower, were creditable. For six plants Mr. R. Thirsk, 11, Grove Villas, Beverley, secured the leading award with *Vivian Morel*, especially good in condition, each plant carrying about five good blooms; Mr. Coates second. Mr. R. Thirsk also had the best bush-grown plants, staging the three members of the *Vivian Morel* family. Mr. W. H. Young, 16, Florence Avenue, Somerscales Street, Hull, won for three trained specimens.

Cut blooms were fairly numerous, and of good quality; but one class is here provided for large blooms in vases—that an attractive one—three distinct Japanese, five blooms of each, and which produced keen competition and a good display of high class blooms. Mr. F. S. Vallis, Fruit Farm, Bromham, Wilts, was an easy first prizetaker with very fine examples of *T. Carrington*, *Edwin Molyneux*, and *Mrs. J. Lewis*. Mr. G. Walker, gardener to C. E. A. Lyon, Esq., The Lair, Hornsea, was second; Mr. C. Jennings, gardener to F. W. Jameson, Esq., Aston Hall, North Ferriby, third.

Incurved varieties showed a slight falling off in point of numbers. For twenty-four in not less than eighteen varieties but two competed, Mr. J. Mudd, gardener to J. Cutts, Esq., 8, Zulla Road, Carrington, Nottingham, was first with large, somewhat rough blooms; F. Palmer, Louisa Giles, Ialene, Nellie Southam, and Ma Perfection were the most noteworthy. Mr. A. Jones, Hadley Manor, Barnet, Herts, second.

Five competed with twenty-four Japanese distinct, making a good display. Mr. Vallis once more scored an easy victory with large, well-developed examples of *Mrs. Mease*, *Australie*, *Mrs. J. Lewis*, *Le Grand Dragon*, *Marquis Vicomte Venosta*, *G. J. Warren*, *Mrs. Vallis*, *Edwin Molyneux*, *Mons. Chenon de Leché*, *Madame Carnot*, *Mrs. J. Bryant*, *Madame Paolo Radaelli*, *Matthew Smith*, *Calvat's '99*, *W. R. Church*, *T. Carrington*, *M. Louis Remy*, *Madame Herrewége*, *Mrs. Hummell*, *F. S. Vallis* fine; *Nellie Pockett*, *Mrs. Barkley*, *Charles Longley*, and *Ethel Fitzroy*. Mr. T. Mudd second; Mr. J. P. Leadbetter, gardener to A. Wilson, Esq., Tranby Croft, Hull, third.

Anemone-flowered varieties were well shown by Mr. T. B. Hanson, gardener to W. R. Ringrose-Voase, Esq., J.P., Anlaby House, Jarrow; *Descartes*, *Mrs. Judge Benedict*, and *Nelson* were the best. Mr. Coates second. Mr. R. Walker, gardener to Major Stracey, Clitheroe, Hotham Hall, Brough, won for twelve reflexed with typical examples of golden and pink *Christine*, *Florence Lunn*, and *Dorothy Gibson*. Mr. H. Willcocks, gardener to A. S. Wilson, Esq., M.P., Raywell, Cottingham, second. The best pompons in twelve bunches were staged by Mr. W. Goodhill, Mayfield Avenue, Hull; the best single-flowered by Mr. T. B. Hanson.

Local classes were much better represented than those open. Especially good were the incurved blooms in the class for eighteen, for which a silver cup and a money prize was offered, Mr. C. Jennings winning the coveted position with much the best blooms in the show; *Miss Annie Hills*, *Duchess of Fife*, *Globe d'Or*, *Hanwell Glory*, and *Matthew Russell* were particularly fine. Mr. C. Flower, gardener to R. Hodgson, Esq., Molescroft, Beverley, second. For twelve incurved, not less than nine varieties, five competed, Mr. R. Walker winning with typical examples of *Madame Ferlat*, *Lord Alcester*, *Princess of Wales*, *Hanwell Glory*, and *J. Agate*; Mr. C. Jennings a close second.

Japanese were a strong feature. For eighteen distinct, five staged. The best, a heavy set, came from Mr. G. Walker, gardener to C. E. A. Lyon, Esq., The Lair, Hornsea; Mr. J. W. Backhouse, The Bar, Beverley, second. Mr. G. Walker also won for twelve Japanese, Mr. C. Jennings second. A most interesting class was that for two bunches each, three blooms in a bunch, of *Mrs. G. Rundle*, *Mrs. Dixon*, and *G. Glenney*. Mr. V. Waterhouse just won with typical examples of these old favourites. Mr. W. H. Franklin, Cheney Garth, Cottingham, an exceedingly close second. Amateurs staged capital blooms in their classes.

The premier Japanese bloom in the show was *Florence Molyneux*, exhibited by Mr. J. W. Backhouse in a local class, beating many in the open division; a similar honour falling to *Fred Palmer*, incurved, staged by Mr. Mudd in the open class for twenty-four.

The classes open to ladies only here are always an important feature, shown as they are by gaslight. The leading class is that for the best decorated dessert table, 8ft by 4ft, completely laid out for six persons, Chrysanthemums to be the only flowers used, with any kind of foliage or grasses. A piece of challenge plate value ten guineas, with a sum of four guineas added, is the leading prize. Six entered, making a capital display. *Miss Fanny Kirk*, Owstwick Hall, Burstwick, Hull, once more succeeded in winning the coveted award, and as this is the third time, it now becomes her absolute property. White Chrysanthemums were employed, which harmonised so well with the richly coloured sprays of *Ampelopsis Veitchi* and deep green *Asparagus*. The fruit and silver were all of a choice character, the whole exhibit being worthy of its position. *Miss Ethel G. Fisher*, Willesby Hall, Hull, a creditable second; *Miss A. K. Brown*, Preston Cottage, Hull, third.

A capital class was that for the most tasteful arrangement of cut flowers with any kind of foliage, grasses, and berries on a table-space of 3ft each way. *Miss Ethel G. Fisher* was an easy first with good Japanese Chrysanthemums associated pleasingly with *Asparagus*, &c. *Miss W. Kirk* second; *Miss Ella Pudsey*, Anlaby Road, Hull, third. *Miss B. Kirk*, Owstwick Hall, Hull, had the best Chrysanthemum epergne for a dinner table, being closely followed by *Mrs. H. Scotter*, 116, Argyle Street, Hull.

### Liverpool Horticultural, Nov. 12th and 13th.

The twenty-third Chrysanthemum and Fruit Show is past and gone, and the general opinion of all visitors is that the proud name which Liverpool growers have always maintained is not in the least tarnished, but rather enhanced, by the high standard throughout the more than close competition, and an altogether brighter and more diversified arrangement than has hitherto been seen in the handsome St. George's Hall.

The topic uppermost in the minds of exhibitors is now (as always) the cup class for twenty-four incurved and twenty-four Japanese, and once again that excellent cultivator, Mr. J. Heaton, gardener to R. P. Houston, Esq., M.P., The Lawn, Aigburth, scored a great victory, taking, for the fifth year in succession, this valuable prize, which, in addition to the money given by the Association, carries with it the beautiful twenty guinea challenge cup presented by Mr. Houston. This is a record in the annals of Liverpool horticulture, and a more deserved honour and a better recipient for the prize than Mr. Heaton could not well be found. The services of Messrs. T. Foster, chairman; Mercer, vice-chairman; and H. Sadler, secretary, deserve hearty recognition. The show was visited by the newly elected Lord Mayor (Mr. Watson Rutherford) and the Lady Mayoress.

Cut Blooms.—In every class there was a spirited competition, the cup drawing five exhibitors, Mr. Heaton winning with fresh, deep, and highly coloured flowers, much enhanced by the fact that all his Japanese had simply an incurved cup as their support, the Japanese cup being for the nonce dispensed with. The varieties were *Rev. W. Wilks*, *Mrs. Mease*, *Mafeking Hero*, *Mrs. J. Lewis*, *G. Carpenter*, *M. L. Remy*, *Lady Ridgway*, *Madame G. Henri*, *Mrs. Greenfield*, *Mrs. J. Coutts*, *Edith Shrimpton*, *Mrs. J. Bryant*, *Miss E. Fulton*, *W. R. Church*, *Mrs. Barkley*, *M. Chenon de Leché*, *Pride of Exmouth*, *C. Longley*, *Loveliness*, *Alice Byron*, *Sir H. Kitchener*, *Phœbus*, *Nellie Pockett*, *Lord Ludlow*, *Mrs. M. Molyneux*, *C. Curtis*, *Mrs. H. J. Jones*, *Madame Ferlat*, *General Symons*, *Lady Isabel*, *Ernest Cannell*, *Duchess of Fife*, *Mrs. Egan*, *C. Bruant*, *Ialene*, *Queen of England*, *Nellie Southam*, *J. Lambert*, *J. Doughty*, *Parlé Palace*, *Lord Alcester*, *Topaze*

Oriental, Hanwell Glory, W. Tunnington, J. Agate, Mr. W. Harvey, and N. Perkins. A capital second was Mr. Findlow, gardener to A. J. Oakshott, Esq., Oaklands, Lower Bebington, his best being Godfrey's Pride, Mrs. Barkley, Marquis V. Venosta, Madame Paolo Radaelli, C. Longley, Bessie Godfrey, Madame Ferlat, Topaze Oriental, F. Palmer, and Annie Hills. Mr. W. Whittle, gardener to R. G. Allan, Esq., Rosemont, Aigburth, a very close third, and Mr. G. Haigh, gardener to Sir W. Tate, Bart., fourth.

Incurved were good considering the season, the eighteen being captured by Mr. P. Greene, gardener to Colonel T. Gee, Allerton, with General Symons, W. Tunnington, Lady Isobel, E. Cannell, Annie Hills, and J. Lambert. Mr. J. Young, gardener to S. Williamson, Esq., Otterspool, was the second, and Mr. C. Osborne, gardener to A. Cook, Esq., Aigburth Hall, third.

For twelve, Mr. T. Carling, gardener to Mrs. Cope, Dove Park, Woolton, scored with fine blooms of Lady Isobel, F. Palmer, and C. Bruant; Mr. G. Osborne, gardener to Dr. Cook, Tue Brook, second. Mr. J. Powell, gardener to Mrs. Whittle, for six. A decided victory was won by Mr. J. George, gardener to T. Henshaw, Esq., Whitefield House, Roby, for eighteen Japanese, Mrs. Crompton, W. R. Church, Mrs. Barkley, C. Longley, T. Carrington, Ella Curtis, Pride of Madford, and Lord Ludlow being special. Mr. J. Young second, and Mr. J. Osborne third, each showing very strong. Five staged. Six competed for twelve Japanese, the winner, Mr. C. Jones, gardener to E. Evans, Esq., Spital Old Hall, having fine Mrs. Mease, W. R. Church, and Mrs. Barkley; second, Mr. G. Osborne; third, Mr. T. Eaton, gardener to J. Parrington, Esq., Roby Mount, Roby. For six, Mr. J. Bradshaw, Rock Ferry.

The Vase Competition was composed of bold flowers, short of elevation, but a splendid class withal, Messrs. J. George and J. Williams being first and second respectively.

The trade quite excelled all previous efforts, Messrs. R. P. Ker and Sons, Aigburth, contributing superb Cyclamen, Begonias Gloire de Lorraine and Caledonia, &c. The mildness of the season was exemplified by a beautiful selection of Caetus Dahlias from Messrs. Diekson, Limited, Chester.

Messrs. Rowlands, West Derby, and T. Davies and Co., Wavertree, had rich miscellaneous plants. A table of very choice Orchids from Messrs. Jno. Cowan and Co., Limited, found many admirers.

From Messrs. W. Wells and Co., Earlswood, Surrey, came several new varieties of Chrysanthemums, S. T. Wright being eagerly sought after. A great attraction in the show were the superb samples of Apples from Messrs. Alexander Diekson and Sons, Newtownards, Co. Down, and Ledbury.

The fruit classes at Liverpool are almost as much admired as the cut blooms. The high coloured Apples and Pears from Mr. J. Davis, gardener to W. E. King King, Esq., Bodenham; the splendidly finished Museat of Alexandria and Golden Queen Grapes from Mr. Skitt, gardener to Mrs. H. A. Bright; Knotty Ash, Alnwick; seedling from Mr. T. Elsworthy, gardener to Messrs. W. L. and R. F. Gladstone, Court Hey, Broadgreen; Alieantes from Mr. J. Barker, gardener to J. W. Raynes, Esq., Penniaen, Old Colwyn; and Muscats and Alicantes from Mr. Hammond, gardener to Colonel Blackburne, Hale Hall, all kept up the high standard usually seen here.

Orchids were much superior, making a brilliant display in front of the orchestra, Messrs. J. Bracegirdle, gardener to W. H. Watts, Esq., F. Keightley, gardener to Mrs. Dunean, W. Barber, gardener to Walter Holland, Esq., and W. Fleetwood, gardener to Dr. Solomon, each scoring victories.

Miscellaneous plants were a distinct feature, the class for Begonia Gloire de Lorraine proving strong, delightful examples coming from Mr. E. R. Finch, gardener to G. Smith, Esq., Newstead, Wavertree. Poinsettias from Mr. W. Lyon, gardener to A. Mackenzie Smith, Esq., Bolton Hey, Roby, and Mr. J. George, gardener to T. Henshaw, Esq., Whitefield House, Roby, caused quite a sensation, so well were they grown. Mr. Bracegirdle made a big hit with exotic Ferns and Chrysanthemum group. Table decorations looked attractive; pity is that in the floral work a breakaway cannot be made in colour from the bronze, of which there was an altogether overpowering array.

A capital basket came from Mr. G. Haigh, gardener to Sir W. Tate, Bart., Highfield, Woolton; that for the best table going to Mr. Armistead, gardener to Mrs. T. A. Vlasto, Sefton Park. Trained and staked plants made a fine contribution, the prizes falling to Messrs. J. Rose, gardener to J. G. Kitchen, Esq., West Derby, H. Wilson, gardener to H. Cunningham, Esq., Gateacre, F. Keightly, gardener to Mrs. Dunean, Grassendale. —R. P. R.

### Parkstone, November 12th and 13th.

This society held its tenth annual exhibition of Chrysanthemums, fruit, and vegetables on November 12 and 13. Undoubtedly it proved to be a better show than any of its predecessors. Both days were beautifully fine, and visitors came to the show in large numbers, and were feasted with a splendid

display of blooms, both in a cut state and growing on plants in pots. Evidently the culture of the Chrysanthemum is one of the chief recreations of the people of Parkstone, if one may judge from the results of their efforts and the liberal support which they give to the society. The officials are to be congratulated upon their good work.

In the leading class for twenty-four Japanese cut blooms, not less than eighteen varieties, Mr. W. H. Dore, of Branksome Towers, was an easy first. His stand contained some really grand flowers; J. R. Upton, Mrs. Barkley, W. R. Church, Australie, J. Molyneux, and Miss A. Byron were extra good. The last named was awarded the prize for the premier Japanese bloom in the show.

Incurved sorts are generally well staged at this show, notwithstanding the fact that this section is not so popular as it was a few years ago. The Rev. C. H. Burrows secured first prize for a nice even stand of blooms, in which Ma Perfection was selected as premier incurved flower in the show. A new feature is the class for cut blooms with long stems, staged as cut, in deep vases.

In the vegetable and fruit classes Messrs. Horlock, Rabbits, Honeybun, and Riggs were the chief prizewinners. Table decorations are always very tastefully shown at Parkstone. Mr. Palmer carried off chief honours for a dinner-table decoration, in strong competition, Miss M. D. Kelly being a very close second. For a single epergne of mixed flowers and foliage Miss Vivian was first, and Miss K. Light second. The last named lady secured first prize for three buttonhole bouquets, Mrs. Riggs taking second place. For shoulder sprays of mixed flowers and foliage Miss Light again carried off the first prize, and Mrs. Palmer the second.

The amateurs' and cottagers' classes were well filled with fine produce. The youngest exhibitor was eight years of age and the oldest eighty-five, the latter entering the lists for the first time—truly a veteran with commendable hope and pluck.

### Winchester, Nov. 12th and 13th.

This society held its twentieth annual autumn exhibition in the Guildhall, and was in every way a great success. There were numerous entries, and the quality of the exhibits far surpassed those of many other societies of the present season. The arrangements were, as usual, well carried out by the energetic secretary, Mr. C. Shenton, assisted by an efficient committee, whose chairman, F. W. Flight, Esq., takes keen interest in all points of horticulture.

CUT BLOOMS.—The class in which most interest centres is that for forty-eight blooms, twenty-four incurved, the remainder Japanese, all distinct, and for which a challenge cup is offered, together with substantial money prizes. There were four entries. Mr. W. Neville, gardener to F. W. Flight, Esq., Cornstiles, Twyford, Winchester, was first with fine blooms in the Japanese section, whilst the incurved left but little to be desired. The varieties were:—Japanese: Duchess of Sutherland, T. Carrington, Mons. Louis Remy, Sir H. Kitchener, Edith Dashwood, Alice Byron, W. R. Church, Madame Paolo Radelli, Mrs. E. W. Palmer, Mrs. T. Wood, Emily Towers, Mrs. T. Poekett, General Hutton, Mrs. W. Weeks, Violet Lady Beaumont, Mons. C. de Leché, Mrs. Greenfield, Lord Salisbury, Lord Ludlow, Marquis V. Venosta, Ethel Fitzroy, Jane Molyneux, Mrs. W. Cursham, Le Grand Dragon. Incurved: Frank Hammond, Ma Perfection, Hanwell Glory, Nelly Southam, Lady Isobel, Louisa Giles, C. H. Curtis, Madame Ferlat, Pearl Palace, Fred. Palmer, Matthew Russell, Thomas Lockie, Nellie Threlfall, Chrys. Bruant, Comtesse d'Estoile, Mrs. R. King, Mrs. W. Howe, Major Mathew, Topaze Orientale, Duchess of Fife, Madame de Verneuil, Miss A. Hills, Mons. Bahuant, Mrs. R. C. Kingston. Mr. J. Hughes, gardener to Messrs. Hart and Son, Guildford, was a good second. His most noticeable blooms were Madame Carnot, Lady Hanham, Mrs. Mease, and Charles Davis, in the Japanese section, and C. H. Curtis, Miss Annie Hills, G. Haigh, and Hanwell Glory in the incurved. Third, Mr. W. Meredith, gardener to A. Wilder, Esq., Stanstead Park, Emsworth. In the next class, that for thirty-six Japanese, not less than twenty-four varieties, there were four entries, the whole making an effective display. The first prize winner being Mr. G. Nobbs, gardener to His Majesty the King, Osborne, with good blooms of Australie, Mrs. E. Barber, Mrs. Barkley, C. Davis, Le Grand Dragon, Mrs. W. Mease, J. R. Upton, Lady Hanham, Florence Molyneux, Lady Salisbury, Mrs. J. Bryant, M. Louis Remy, and Lord Ludlow. Mr. Neville a close second, Mr. Meredith, third.

Mr. Neville won for twelve distinct incurved, with fine neat blooms of Duchess of Fife, C. H. Curtis, Pearl Palace, Chrys. Bruant, Nellie Threlfall, Miss A. Hills, Miss N. Southam, Madame Ferlat, Lady Isobel, and Ma Perfection. Mr. Hughes was a close second, and Mr. J. Wasley, gardener to J. B. Taylor, Esq., Sherfield Manor, Basingstoke, third.

For twelve distinct Japanese, amidst keen competition, Mr. L. Dawes, gardener to Mrs. Ogilvie Hambleton, secured first with medium-sized richly coloured blooms of Mons. Hoste, Edwin Molyneux, Sir H. Kitchener, Mrs. J. Bryant, Mrs. Barkley,

W. R. Church, Mrs. G. Mileham, and Pride of Madford. Second, Mr. G. Best, gardener to F. D. Leyland, Esq., The Vyne, Basingstoke, amongst his best being Miss Alice Byron, M. Louis Remy, and Mafeking Hero. Third, Mr. W. J. Privett, Frensham Place, Farnham. In the vase class, nine varieties, three of each, Mr. Wasley won with fine examples of Mrs. Barkley, Lord Ludlow, Mrs. Mease, T. Carrington, Madame G. Henri, G. W. Palmer, Australie, and Madame P. Rivoire; Mr. Meredith and Mr. Neville following closely.

For six varieties, three of each, shown also in vases, Mr. G. H. Street, gardener to the Rev. Dr. Burge, The College, Winchester, was an easy first, with good blooms of leading varieties. Mr. P. Newton, gardener, to H. H. Walford, Esq., Arlebury, Alresford, second.

Mr. W. Hunt, gardener to J. Moss, Esq., Fern Hill, Blackwater, was a successful exhibitor in the section for Japanese varieties grown without disbudding, showing fine bunches, amongst which were noticed Roi des Precoces, N. C. S. Jubilee, and V. Morel. Mr. Dawes second. The same opponents occupied similar positions for twelve bunches pompons, Mr. Hunt winning easily, with fine examples, well staged. Plants, as always at this exhibition, were a distinct feature, only one or two classes falling short of the average entries. For the best collection arranged in a space of 8ft by 7ft, quality, size of blooms, compact growth, good foliage and general appearance, Mr. G. H. Street was an easy first, with compact plants, carrying good blooms, and not too stiffly arranged. Mrs. G. Mileham, W. R. Church, Mons. C. de Leché, Alice Byron, Hooper Pearson, and Ma Perfection were particularly noteworthy. Second, Mr. R. Stone, gardener to the Ven. Archdeacon Haigh.

Decorative plants are of special interest here. For six, suitable for conservatories, grown in 9in pots, carrying not less than five blooms, Mr. G. Adams, gardener to Col. F. A. Dickens, Edge Hill, Winchester, secured first with G. W. Palmer, T. Carrington, Swanley Giant, Lady Hanham, and Mrs. Mileham, each carrying seven good blooms with good foliage. Mr. H. Grigg, gardener to Rev. R. M. Moorsom, Holyrood, Winchester, second. In a similar class for any white flowered varieties Mr. Adams was again successful, winning easily with Madame Ferlat, Miss Alice Byron, and Niveus in good form. Second, Mr. G. Cousins, gardener to E. H. Buckland, Esq., Southgate House. For six yellow flowered varieties, Mr. Adams was again the winner with Topaze Oriental, Scottish Chief, Louisa Giles, and W. H. Lincoln in splendid condition. Mr. Gigg second. Three decorative plants not grown under glass were staged by Mr. E. Yarrow, 38, North Walls, and Mr. W. J. Elkins, The Close, the two winning in the order named. Again, Mr. E. Yarrow was first for one Japanese plant untrained, James Bidencope, carrying ten fine blooms. Mr. S. Clifton, Clifton Road, second. For an untrained specimen, any variety, Mr. A. E. Taylor, Hill View Terrace, Bar End, was first with a fine plant of Mrs. Barkley. Mr. Yarrow second.

In the classes for ladies only there is always keen competition, their exhibits adding greatly to the beauty of the show. Mrs. Jeffery won for the most tastefully arranged stand of flowers, foliage, and grasses, with an exhibit very lightly arranged. Miss M. Clark, St. Cross, second. For the most tastefully arranged table, Miss Wadmore, Brook House, Basingstoke, was the successful winner, with an arrangement that left nothing to be desired. Mrs. W. Arnold, Lymington, second.

For a stand of flowering shrubs, coloured foliage, grasses, berries, &c., gathered from the open, Miss M. Clark was an easy first with a charming exhibit. Mrs. W. Arnold again second. Miss Wadmore exhibited a very beautiful basket of flowers and foliage, composed chiefly of Orchids, and was an easy first, Mrs. Jeffery second, with a good exhibit.

Fruit was well staged and good. For three bunches of Grapes, distinct, the first prize went to Mr. W. Mitchell, gardener to J. Willis Hemming, Chilworth Manor, North Stoneham, who showed fine bunches of Alicante, Muscat of Alexandria, and Mrs. Pince. Second, Mr. T. Hall, gardener to Sir S. Montague, Bart., South Stoneham House. Mr. Mitchell again won for two bunches any colour, with fine examples of Muscat of Alexandria. Mr. T. Hall was first for both dessert and kitchen Apples, three dishes of each, each exhibit being of good quality.

The best group of miscellaneous plants, arranged for effect in a space 9ft by 7ft, was a great addition to the show. The prize-winner being Mr. E. Long, gardener to F. C. Birch, Esq., Clovelly, Winchester, his exhibit being most praiseworthy. Second, Mr. H. J. Pittman, gardener to Mr. Sewell, Oakwood, Otterbourne. Primulas are also a great feature here, this year's display being quite an average one. For twelve plants Mr. Adams was first with fine examples. Second, Mr. F. A. Padwick, gardener to S. Aylward, Esq., Dingley. Mr. G. H. Street had the best six pots double flowered varieties, and Mr. F. Smith those of the single flowered section.

Vegetables were fairly good. Mr. G. Best was the most successful exhibitor in both classes, open only to Messrs. Sutton and Sons' and Toogood's customers. Mr. W. Mitchell following closely in both cases.

"Not for competition" exhibits deserve mention, being of a meritorious character. Messrs. E. Hillier and Sons, Winchester, contributed a fine collection of Apples arranged effectively, interspersed with plants, noticeable varieties being Golden Spire, The Queen, Royal Jubilee, and Peasgood's Nonesuch of the former. From Mr. G. Ellwood, gardener to the president, W. H. Myers, Esq., M.P., Swannore Park, came an attractive exhibit of Japanese Chrysanthemum blooms and foliage plants, very tastefully arranged. Mr. C. Kench, gardener to J. S. Moss, Esq., Wintershill Hall, Bishops Waltham, staged a fine collection of Orchids of high quality.

### Weston-super-Mare, November 13th.

Good weather and large attendance favoured this society for its annual show on the above date, and neither the extent of competition nor quality of individual exhibits gave cause for fault-finding. Though numerous classes are provided for trained Chrysanthemums and other decorative plants, those for cut blooms naturally enlist first interest, and here there was keen competition. For twenty-four incurved, not less than eighteen distinct varieties, there was a good entry, Mr. J. W. Drake, of Cardiff, winning in his well-known good form. His best comprised Nellie Southam, Ialene, Mrs. R. C. Kingston, C. Curtis, Louisa Giles, C. B. Whitnall, N. Threlfall, Edith Hughes, Violet Foster, Hanwell Glory, and Madame Ferlat, with the latter the certificate was gained for the premier bloom. Colonel Vivian, Rood Ashton (gardener, Mr. W. Strugnell) won second, and Messrs. W. Brooks, Weston, third. For the same number of Japanese, distinct, Mr. Drake was again first, Guy Hamilton, Mrs. Hummell, M. L. Remy, W. R. Church, Chas. Davis, Mrs. Greenfield, Matthew Smith, Mrs. Barkley, and Lord Salisbury being his best. Mr. Robertson, gardener to J. S. Donne, Esq., Castle Cary, second; T. A. Colfox, Esq., third. Mr. G. Sutton, gardener to W. A. Todd, Esq., Portishead, won with twelve varieties, Mr. Strugnell following. The premier Japanese bloom was a fine Madame A. Henri in Mr. Sutton's stand. Many miscellaneous classes for plants were provided, including groups of Chrysanthemums and stove and greenhouse plants, in which growers from Clifton, Portishead, Weston-super-Mare, and surrounding districts competed.

Fruit was very well staged. Grapes had three classes, Mr. Daffurn, gardener to Colonel Bramble, winning with Alicante and "any other variety," C. E. Whiting, Esq., staging the best white Muscats. Apples and Pears, in separate classes of four dishes and one dish respectively, brought out a spirited entry, and first-rate fruit, both in culinary and dessert classes.

Messrs. Vauces and Hortsman, joint hon. secretaries, deserve well of their patrons and competitors for the business-like tact which is brought to bear upon the work of the show, especially considering the wavering fortunes of the society's finances.

### Edinburgh, November 13th, 14th, and 15th.

This highly popular exhibition, promoted by the Scottish Horticultural Association, was held in the Waverley Market, Edinburgh, on Thursday, Friday, and Saturday of last week, and was attended with its usual success. This exhibition, held in the most spacious exhibition hall in the kingdom, is probably the largest out of London, and this season in many respects exceeded the National. The entries were not quite so numerous as they were the last year or two, but the backwardness of this season in Scotland fully accounted for this, and did not arise from any waning popularity with growers. The principal falling off was in the decorative vases for undisbudded blooms, which in Edinburgh are always a handsome show; but the lateness of the season told severely on entries, and instead of over thirty, as last year, there were only eight competitors. The great hall had an imposing appearance, gaily decorated, and laid out with Palms and other large foliage plants (specially hired for the occasion) like a huge conservatory, marvellously different from the rows of blooms on bare boards as were seen in the great vase classes in St. Stephen's Hall at the Aquarium. The weather during the show was most auspicious, and the attendance of visitors was very large on all three days, over 35,000 visitors having paid at the stiles. The gate-money amounted to £958 10s.; which does not include members' subscriptions or money from tickets sold outside in the seed shops, &c. Altogether the visitors would total up to about 42,000.

CUT BLOOMS.—The leading prize was the great vase class designated "The City of Edinburgh Victoria Memorial prize," for which the City of Edinburgh gives plate value £20 and £10 in cash. The Association adds £20 as second, £15 as third, £10 as fourth, and £5 as fifth prizes. There were seven entries, who all toed the mark, and on the whole contributed blooms of great merit, though probably not quite equal to the blooms of last season. After long and anxious scrutiny, the judges—Messrs. Molyneux and M'Hattie—awarded the premier position to Mr. Lunt, gardener, Kier, Stirling, this being the fifth year in succession that this distinguished cultivator has occupied first

position for the Edinburgh "Blue Riband." Mr. Lunt was not so clearly ahead of his rivals as he was last year, but the evenness, freshness, and high quality of his blooms carried him through. The most prominent varieties were Princess de Brancova (one of which was awarded the medal as the finest bloom in the show, and said by Mr. Molyneux to be the finest Japanese bloom seen this season), Loveliness, Mrs. S. Fryett, Edith Shrimper, Mrs. E. Hummell, C. Jarvis, Mrs. G. Mileham, J. R. Upton, M. Louis Remy, Miss Elsie Fulton, Mrs. H. Weeks, Lady Ridgway, &c. Mr. Kenyon, Woodford, Essex, was placed second with a very imposing display, which many thought, previous to the judging, might lower Mr. Lunt's colours. The blooms were very large, but wanted the fresh colour of the first prize blooms, and in several instances the third bloom of some of the varieties was very weak; close scrutiny amply justified the decision. In this stand Bessie Godfrey and W. R. Church were very prominent. Mr. Nicol, Rossie, Forgandenny, a very clever Scotch grower, was third, also with beautiful flowers, a very prominent variety being Florence Molyneux. Mr. Beisant, Castle Huntly, was fourth with good blooms, a very prominent variety being Madame Paolo Radaelli; Mr. James Martin, Corn-dean Hall, was fifth with creditable blooms. The two outclassed lots were from Mr. Mackinlay, Wrest Park, Amptill, and Mr. Johnston, Shann Castle, Ireland. The Irish blooms might have had a different fate but for being slightly injured by the journey. The Arranging Committee deserved great credit for the manner in which this class was exhibited. It was probably the most effective table of "Mums" ever seen, arranged in three tiers on a crescent-shaped table, and backed up behind with foliaged plants such as Bamboos, Palms, &c. The effect was most imposing, while a special installation of electric lights, suspended over the blooms, in the evening gave a brilliance to the exhibit which words can hardly fully describe.

Next in importance was the competition for the Scottish Challenge Cup and a first of £10, confined to Scottish growers, competitors for the previous class being debarred. The prize was for twelve vases of three blooms each, in twelve varieties. This was cleverly won by Mr. Cumming, gardener, Grandtully, Aberfeldy, and showed that even in sight of the Grampian Hills, and in a cold, sunless season, skill and attention overcomes difficulties. His varieties were Mrs. H. Weeks, Mrs. Barkley, Mons. Chenon de Leché, W. R. Church, Mrs. J. Lewis, Mrs. G. Mileham, Madame Gustave Henri, M. Louis Remy, Australie, Lady Ridgway, and Nellie Pockett. Mr. L. McLean, Greenfield, Alloa, was a good second in this class; Mr. Nicholson, Strathallan Castle, third; Mr. Kidd, Carberry Tower, fourth; and Mr. McKay, Lasswade, fifth. There were ten competitors.

There were numerous other classes for Japanese blooms in vases, and the competition was very keen. The principal class was for four vases, with six blooms in each; for this there were fifteen competitors. Mr. Lunt was again victorious with very handsome blooms, Mr. Kidd second, Mr. McLean third, and Mr. Norman, Alloa House, fourth. A strong class was for two vases of six blooms each. For this there were no fewer than eighteen competitors, the premier ticket being awarded to Mr. Baird, Arnbrae, Cambus; second, Mr. R. Whannel Drum, Greenend; third, Mr. W. Lumley, Broomhall, Dunfermline. Other classes of Japanese blooms in vases were keenly competed for. Chrysanthemums on the old-fashioned boards are not much in evidence at Edinburgh, but the prize for twelve blooms brought ten lots together, mostly of splendid quality. Here Mr. Kenyon defeated Mr. Lunt, with a stand of very fine blooms. Mr. Lunt was a very good second, and Mr. Martin a fair third. Incurred varieties were a small show, Mr. Martin being allowed a walk over for twelve blooms. For six blooms Mr. Martin was again first, and Mr. Wood, Larbert, second. For three vases, singles, Mr. D. Kidd was first, and Mr. Boucher, Cathcart, second. For the class of three vases decorative sorts, not disbudded, there were only eight competitors this season, instead of thirty last year, blooms from the terminals not being yet ready in Scotland. The first was awarded to Mr. James Middleton, St. Catherine's, Liberton.

Chrysanthemum plants were a fair show for the season, but not so good as usual, yet in all nearly 150 plants were entered. The chief class was for six plants, and with very fair specimens Mr. Michie, Boroughfield, Edinburgh, was first, and Mr. Pullman (last year's winner) second.

In the art department of Chrysanthemums the display was smaller than usual, and some things, notably bouquets, not up to the usual Edinburgh standard. The bouquets were, however, much superior to those competed with at the National, thus justifying the criticisms of an "Edinburgh Florist" at the Aquarium. Miss Geddes, Murrayfield, was first; and Mr. Fairweather, West Ferry, second. For basket of coloured foliage and berries Miss Geddes was also first, and Mr. Knight second. The competition in this class has fallen off since Croton and other variegated leaves have been allowed, instead of coloured autumn foliage, as was originally intended. The amateur classes for Chrysanthemums were not well filled, Mr. Stewart, Woodend, Alloa, and Mr. Adam Brydon, Innerleithen, dividing most of the prizes.

### Fruit Forcing.

**VINES: EARLY FORCED VINES IN POTS.**—The earliest started Vines—those set to work at the beginning of the month to afford ripe Grapes in March—will now be showing signs of growth, so that the temperature may be slightly increased, maintaining 55deg and 65deg maximum by fire heat, advancing to 75deg or more from sun heat, proportionately increasing the atmospheric moisture. The ventilation will require to be moderate, and what is given should be at the top of the house. If side ventilation be employed the cold air must be made to pass over the heated surface, so as to become warmed, for cold currents of air are extremely pernicious.

Stout, well ripened canes, with plump buds, and given a short rest, may be started now for ripening their crops of Grapes fit for table in April. The Vines require a light, airy, efficiently heated structure, such as a lean-to or three-quarter span-roof, and if hot-water pipes are at the front or side the Vines may be stood over them, on tiles or slates. These become heated and transmit some warmth to the pots, which are kept mere or less warm at the base, and the roots are not prejudiced by the heat. Besides, the tiles or slates throw off much of the water or liquid manure supplied to and escaping from the pots, so that there is no risk of a surfeit of steam, and the water running on the floor keeps up a genial moisture as well as supplying ammonia to the atmosphere when liquid manure is used. Where there are pits of about 3ft or 4ft depth, these should be utilised for supplying bottom heat by means of Oak or Beech leaves, the Vines being stood on pedestals of loose bricks, so as to raise the pots to the required height, then placing on the leaves, which produce a genial warmth and regular moisture in the early stages, and rich stimulating food when the demands of the Vines are greatest. The canes should be kept horizontally, or have the ends depressed if necessary, to insure their breaking evenly from the base upwards. The heat at the base of the pots must not exceed 70deg to 75deg, top heat 55deg, sprinkling the canes lightly twice a day, and keeping the soil moist, not wet. Black Hamburg and Foster's Seedling are most suitable for early work. White Frontignan fares well, but the fruit is small, though the quality is excellent, and Madresfield Court is one of the best forcing varieties and first-rate in both appearance and quality.

**EARLY FORCED PLANTED-OUT VINES.**—To have ripe fruit in May with certainty the house must now be closed. This more particularly applies to young and vigorous Vines, that do not, as a rule, start into growth so quickly as those that have been forced before. To produce a humid atmosphere and to economise fuel a good ridge of fermenting materials may be placed on the floor or inside border, and be turned at intervals, additions being made as the heat declines. Old Vines will not need depressing, but it is a good practice to lower them until the buds break before securing to the trellis. In the case of young Vines the canes or rods will need to be brought into a horizontal position, depressing the points, and syringing two or three times a day with water, slightly in advance of the temperature of the house. The temperature of the house may range 50deg at night, 55deg by day, and 65deg on bright days. The outside border must be protected from wet and frost by a covering of leaves and lights, or by other approved means.

**HOUSES OF THIN-SKINNED GRAPES.**—These, for table purposes, are most esteemed as long as they can be had in good condition. Black Hamburg never surfeits, Buckland Sweetwater, and Foster's Seedling seldom come wrongly, Madresfield Court is always appreciated, and Muscat of Alexandria, with Canon Hall, by universal acclaim, are held superior to all Grapes. The somewhat heavy and continued recent rains have saturated the soil and atmosphere. Air is the great secret in keeping thin-skinned Grapes, for a moderate amount of air moisture is necessary to avoid undue evaporation and consequent shrinking of the Grapes, it not being so much air moisture as a stagnant atmosphere, this causing the deposition of moisture on the berries, that is fatal to the keeping of Grapes. Slight warmth will be required in the pipes almost constantly to maintain an equable temperature, but this must not be high, or it will cause the berries to shrivel prematurely, 50deg not being exceeded by artificial means, or 5deg more for Muscat of Alexandria, ventilating freely and early in bright weather, so as to prevent moisture being condensed on the berries. The outside border will have been covered with some material to throw off the rains, glazed lights being the best, and the inside borders

are better covered with clean chopped straw, so as to prevent their cracking, and to keep down moisture likely to arise and prove injurious.—ST. ALBANS.

### Kitchen Garden.

**LIFTING RHUBARB ROOTS.**—Roots for forcing will shortly be required to be placed in heat, so that a supply of well-coloured stalks may be obtained early. Prior, however, to introducing the clumps of roots into heat it is desirable to bring them into complete rest. This is done to some extent by the lifting, but if this is supplemented by the complete exposure of the clumps to the weather, especially if frosty, an exceedingly salutary check is given, and when placed in the forcing structure they start away into growth more quickly than roots not so treated. Naturally, early varieties of Rhubarb should be selected for early use, as it is obvious such roots will start much more readily into growth. Royal Albert and Champagne are good early varieties, but those who may have a stock of roots of which they do not know the names can always pick out the best for forcing, by reason of the disposition of the crowns to swell early. Lift and prepare the roots of a good portable size. In lifting, work out a trench all round to the depth of 15in to 18in. It will then be possible to undermine the clump, which, if too large, may be divided. The fleshy roots may be cut down so as to reduce the clump to a size easily dealt with.

**SEAKALE FOR FORCING.**—The largest and strongest roots with bold crowns are the most desirable for forcing. The preparation may be made at the present time, now that the leaves have decayed down. The roots grown for the purpose of forcing may be lifted, then trim off all the side roots, and shorten the thick main root to 10in or 12in, if longer than that. The roots should be laid in ashes or soil until required. The first batch of roots may be placed in a dark structure where the temperature is kept at about 55deg. They are best surrounded with soil kept moist. Pots or boxes may also be utilised, inverting similar receptacles over them so as to exclude light.

**SEAKALE ROOTS FOR PLANTING.**—When the smaller roots, or thongs, as they are termed, are trimmed off the forcing roots, those of about the size of a small finger, and 6in in length, should be preserved for the purpose of planting in spring. It is immaterial that these should possess a crown or growing point, but the upper part of root may be cut off transversely and the lower slantingly, so as to distinguish the two. These prepared roots may be laid in soil or sand until spring, tying them together in bundles of twenty-five. The upper part of root will, in spring, form a ring of growths. The weakest of these may be rubbed off before or after the roots are planted.

**POTATOES IN STORE.**—Where Potatoes have not been stored in the best condition, it is essential that the tubers be looked over, and all that have commenced to decay or show signs of disease ought to be picked out. Dry positions must be found for the storage of the tubers, and light excluded by a covering of straw. Bags, dry and sweet, are admirable for storing Potatoes, as these may be packed one above the other if room is limited.

**SELECTING SEED POTATOES.**—If the stock of seed from the tubers in store has to be selected, this may be done when the sorting is done. Pick out the medium-sized and best-shaped tubers, free from disease. Arrange them singly in layers in boxes, which stand in a semi-light position in a cool place, but safe from frost. Of course, the whole of the stock of seed Potatoes, if the quantity is large, cannot be stored in boxes. Except for the tubers which it is intended should be sprouted and planted in this condition, the bulk may be preserved in the ordinary way, but spreading them out thinly rather than in heaps, and omitting covering, for under the action of light and air the skins become green and hardened. These tubers are excellent for planting in rames, as they push stout growths quite early if assisted with a little gentle heat.—EAST KENT.

### British State Forests.

The number of State forests in Great Britain is very limited, and I presume there are not many Crown lands that could be forested; but if the large landowners have not already set the example, they should do so without delay. I wish also to ask whether much notice has been taken by the Government of the letter which Sir Joseph Hooker addressed in October, 1873, to the Colonial Office: "The duty of conserving the natural resources of the Colonies [here referring to the destruction of forests] for the benefit of future generations is becoming the most pressing and arduous duty of those entrusted with the government." And what he advised for the Colonies, has it been acted upon at least in some degree at home?—K.

## TO CORRESPONDENTS

\* \* All correspondence relating to editorial matters should be directed to "THE EDITOR," 12, Mitre Court Chambers, Fleet Street, London, E.C. It is requested that no one will write privately to any of our correspondents, seeking information on matters discussed in this Journal, as doing so subjects them to unjustifiable trouble and expense.

**DISEASED CARNATION LEAVES (C. C.).**—If you will kindly comply with the recognised rule of sending your name and address, which we will not publish, your questions will be considered.

**TRANSPLANTING SHRUBS (J. M.).**—All the shrubs you name will move safely at the present time if the work is carefully done. The positions should be prepared for them before the shrubs are dug up, and as much soil should be retained about the roots as possible. Any rather large bruised or broken roots should be cut off with a sharp knife.

**RIPENING THE WOOD OF PEACHES AND NECTARINES (W. T. P. H.).**—If the wood is now unripe, very little can be done this season, but you may increase the heat and admit all the air practicable day and night until the leaves show indications of falling, when the heat should be turned off. If the leaves have already commenced falling the trees must not be subjected to fire heat, but have free ventilation in favourable weather so as to induce as complete a rest as possible.

**WINTERING PETUNIAS (A. B. C.).**—We do not recognise the plant you were told was a Carnation. The Petunias should be kept near to the glass in a house from which frost is excluded, not giving more water than is sufficient to prevent the foliage from flagging. We should cut the plants back, each shoot to within a few inches of its base, and when the plants have made fresh growth an inch or two in length, shift them into pots a couple of inches larger in diameter, and by tying out the plants and supplying with liquid manure after the pots are filled with roots, the plants will grow rapidly, and, if kept near to the glass and the house well ventilated they will flower freely. The shoots removed may be put in as cuttings, and if kept moist they root safely in a greenhouse, flowering more freely than plants from seed.

**INSECTS ON APPLE TREES (L. K. M.).**—The twigs are infested with the black aphid, which may be destroyed with a solution of Gishurst compound, a strength of 3oz to a gallon of water, applied with a syringe. A fluid ounce of paraffin well mixed in a gallon of water, and similarly applied, squirting a syringe of the paraffin water alternately in the vessel and on the trees, will also destroy the insects and not injure the wood of the trees. The swelling of the spurs of the Pear tree you have sent are quite natural, but the wood does not appear to be quite healthy. Does your garden require draining? The rusting and cracking of the fruit is attributable to inclement weather when the fruit was in a small state. Very wet clayey soils and poor dry sandy soils also contribute to the cracking of fruit, which does not receive the support necessary for healthy progressive growth.

**CHRYSANTHEMUMS AFTER FLOWERING (Rector).**—They may be wintered in a cold pit or frame, cutting them down as soon as the flowers have faded. The young shoots should be taken off with a small portion of root stem, and may be inserted singly in small pots, or three around the sides of a 3in pot; and the pots being placed on ashes in a cold frame, the cuttings will root slowly but surely, keeping them moist, affording slight shade when the sun is bright, and keep them rather close until rooted. They should be transferred to larger pots when the cutting pots are filled with roots, taking out the point of each shoot when about 4in to 6in in length. The old plants, if you wish to keep them another year, may be turned out of the pots, removing all the old soil, cutting the roots back, and repot in 5in or 6in pots.

**VINES IN NARROW BORDERS (G. A. S.).**—You may grow Grapes of good quality, though you are only able to make a border 2ft in width. You will need to put in 6in of rubble for drainage, and over it a layer of turves, grass side downwards. The loam being of a tenacious nature, add to it one-sixth of old mortar rubbish and a twelfth part of  $\frac{1}{2}$ in bones, incorporating thoroughly. The compost should be applied in a rather dry state and made firm. As to the cubic feet of soil to allow to each Vine, that depends on the space the Vines are to occupy. Vines in pots with 8ft of rod succeed in pots containing less than 3ft (cubic) of soil; but we should make the border as large as practicable, allowing at least 12ft to each Vine, and as much

more as you can. It will be necessary to water them liberally with liquid manure when growing. They should be planted when they have commenced growing or when the shoots are about an inch long. Black Hamburg is most suitable, and a good white companion is Foster's Seedling.

**NAMES OF FRUITS.**—*Correspondents whose queries are unanswered in the present issue are respectfully requested to consult the following number.* (B. W. Y.).—1, Beauty of Hants; 2, Blenheim Orange; 3, Boston Russet; 4, a local variety, not recognised; 5, Fearn's Pippin; 6, Carraway Russet.

**NAMES OF PLANTS.**—*Correspondents whose queries are unanswered in the present issue are respectfully requested to consult the following number.* (J. B. B.).—1, The correct name is *Cypripedium insigne* Sander; 2, *Cypripedium Curtisii*; 3, a form of *Cypripedium Goweri magnificum*; 4, *Oncidium varicosum*; 5, *Dendrobium Wardianum*. (F. T.).—*Desfontainea spinosa*. (M. N.).—Probably the Tea Rose, *Souvenir d'un Ami*, somewhat deep toned. (F. T.).—1, *Garrya elliptica*; 2, *Eupatorium odoratum*; 3, *Cryptomeria elegans*; 4, *Cotoneaster frigida*; 5, *Cotoneaster horizontalis*; 6, *Ceanothus Gloire de Versailles*.

## Milk? Butter? Cheese?

We have often noticed, and no doubt our readers have done so too, that just after the big Dairy Show held in London in the autumn, all the farming papers seem much alive to the milk and butter questions. All the old questions are brought up and rediscussed, and sometimes a new one of great import is presented for consideration, and then we all settle down once more into a pleasant, drowsy state with folded hands. Again, too, milk-dealers usually make two contracts in the year, and about the time of the show they have settled, or are about to settle, the price of their milk for the six winter or cold weather months. That a great many farmers have gone into milk selling is more and more apparent, that is in contradistinction to butter-making, and the reason really is not far to seek. As someone observed the other day, England is gradually becoming one vast residential country, and the towns are encroaching upon the suburbs, and the suburbs hardly know a limit, and this population, which is yearly becoming better educated, i.e., more sensibly as regards sanitary or health measures, desires to be fed on milk, or at least to give to milk a prominent place in the dietary table. Hence these are the customers, and the British farmer is wide enough awake to see his opportunity and supply them. So, tiresome and worrying as at times the milk trade is—it will, we believe, continue to grow. It has received many checks at times, such as the high price of feeding stuffs, the scarcity of pasture, the difficulty of collecting accounts, the harassment from railway companies, the sanitary inspectors, and, lastly, this new milk standard business. There is one thing about a deal in milk, once cooled and delivered to the station, the work of milk manipulation is over, whereas if the same milk be taken into the farm dairy

and there in process of time be turned into butter, there is much to be done in the way of actual hard work, and more time is spent before it is ready for the consumer. We do not shirk hard work or we should not farm at all, but if we give of our best in the form of work, we are at any rate entitled to a suitable return. The fact is that farmers as a body have been giving out in many instances more than they received, hence the disasters which have overtaken so many.

Now the question that has been debated lately with great ability in the pages of "The Agricultural Gazette" is this: "Is it better to sell milk or to sell butter?" It is a wide question, and one which must be closely examined before a final opinion is arrived at. We think the great question to be considered is the one of locality, and even then, perhaps, there is less difference here than one would expect. Of course the price of butter per lb. does vary to a certain extent, but nowhere is it so very high. On farms in remote districts we could hardly advise milk selling on account of the expense in conveyance to a station—motors may alter this—and, therefore the milk must be disposed of in the condensed form of butter or cheese, certainly the latter if possible. Perhaps some readers hardly realise that there are still farms ten miles or so from a station, and equally remote from large centres of population. But about milk selling. At Islington the milk is carefully measured and assessed at a certain price, say 9d. per gallon. That milk is afterwards turned into butter and valued in that form, and the result is published. Now it must be borne in mind that the animals which produce this milk are show animals; therefore we will suppose about as good as any that can be found. They have been selected for their dairy properties and carefully fed, and all the tests are carried out by experienced men, and with the greatest exactitude. These are some of the figures, and they are well worth study:—

There is a pedigree Shorthorn belonging to Mr. Merry which yielded in twenty-four hours  $5\frac{2}{3}$  gallons of milk which, valued at 9d. per gallon, would be equal to 4s. 3d. She is considered to have done well in the butter test, as that quantity of milk ( $5\frac{2}{3}$  gallons) made  $2\frac{3}{4}$  lb of butter, which, at 1s. 6d. per lb would be a trifle under 4s. Then we come to a cow of Mr. George Long's—Red Queen—who, by-the-by, won the first prize in her own class for Shorthorns not eligible for the herd book, also won Barham's Challenge Cup and the Lord Mayor's Cup for the best milking Shorthorn. Her milk record was somewhat over 7 gallons per day, but the butter that was produced from her milk only could be valued at a fraction over 3s.

Then we come to a Jersey belonging to the Bishop of Ipswich, whose daily yield of milk was  $4\frac{1}{4}$  gallons, and whose butter produce was  $2\frac{1}{2}$  lb—thus setting as butter money 3s. 9d. per day as against milk money 3s. 2d. Then, again, the same paper (date October 20) makes mention of ten Shorthorns who were either prizetakers or highly commended in the butter tests—picked cows again, mark. In one day their united milk yield was 53 gallons milk, £1 19s. 9d., as against 22lb butter, £1 13s. We do not quarrel with the price at which the milk is rated, viz., 9d. per gallon, but we do very much disagree with the 1s. 6d. per lb charged for butter. We have been good butter-makers for many years, and we have very seldom realised 1s. 6d. per lb save for an odd week or two in the depth of winter. Our average has been much nearer 1s., or perhaps a fraction under, to be nearer the truth. With these facts and figures before us how can we advocate butter-making as a paying industry? We know it is said that the value of the skim-milk and butter-milk makes the total add up a bit better, but even then, unless the price put on those bye products is very much above the market value, there can be no comparison. Possibly now old milk as pig food is at its highest market in value, but pigs surely will not always remain at the famine prices they have now touched. As we have practically given up Wheat growing from a baker's point of view, we shall give up butter culture and devote our cows to stock rearing, milk selling, or cheese making, the value of the latter, we see, being on the up grade.

When we come back to butter making and cheese manufacture we at once pile on the cost of production. One writer says butter is composed of four ingredients, viz., time, muscles, brain, and animal fat, and when it is considered that the price of butter will range from 6d. to 1s. 6d., there is little encouragement to us to try and take

the trade out of the hands of Danish farmers, or, perhaps more properly, factory companies. We know one friend who, with a herd of Jerseys, and with a market in one of the home counties, and whose butter was really of the gilt-edged variety, and practically he could and did pick his customers, has, in consideration of his pocket, gracefully retired from the struggle after some two-and-a-half years' trial. We should like to impress upon our readers once again the fact that, taking the ordinary farmer's cows and allowing them to be good milkers of a non-pedigree strain, it is very very seldom indeed that they can produce 1lb of butter from less than 3 gallons of milk—there may be, and of course are, exceptions to this, but the general rule is 3 gallons—1lb butter. There is another point where a little profit may be made out of the milk trade; this is where the milk is delivered by the farmer himself to his customers. He is not a pushing business man if he cannot, along with the milk, make a trade for eggs, fowls, curd, Potatoes, and other small wares; things on which there is always a bit of profit to be had provided there are no intermediate channels. He will also be looked to if an extra supply of cream is needed, and he may also be able to make a demand for choice fruit and flowers. The milk dealer is always in trouble with his customers, and as a rule settles accounts weekly (there is a very great advantage here).

The idea that has long existed that certain cheeses can only be made in certain localities must now be abandoned. When we see that four out of the five great prizes for Cheddar went to Scotland this year we must acknowledge that technical skill has as much to do with successful cheese making as the situation of the pastures or class of cattle. We may look, again, at some of the Canadian cheeses, which are perfect reproductions of our best makers. But without good sound technical knowledge no one should enter on the calling of cheese making. It is hard work, and for many months in the year constant work. There are many fancy cheeses which meet a ready market, indeed we might say a steadily growing market; and we should almost be inclined to advise that some of these newer varieties should receive a little more attention at the hands of those farmers who are tired of the butter and milk trade.

### Work on the Home Farm.

The Swedes are still growing. We have had a heavy rain, and Swede-pulling could not have been done with any comfort to the men. The dressing and weighing of Barley and Wheat has found plenty of occupation for men and delivery to the station for the horses. This putting on rails from a distance of four and a half miles is slow work. If there were no undue delays two journeys per diem could be managed even in one of these fast shortening days, but, alas! delays at the station are the rule and not the exception. The staff at these country stations is a small one, and can render little assistance at any time, but now that threshing machines are putting in full time everywhere, so much grain is being marketed, that no official help in loading can be looked for, and we have to send an extra man. But that does not prevent delay, though it helps to minimise it. There is often such a block that the waggon cannot be got near the railway truck until others have unloaded and departed. But the most aggravating delay of all is that caused by shunting operations. It frequently occurs that when there are but few sacks left in the waggon, a pick-up train arrives, and immediately removes all the trucks from the siding to sort out loaded ones, and as shunting is never hurried, an hour or more may elapse before the waggon can again be got to the truck-side. No wonder waggoners are addicted to strong language. We want the steam cultivator to plough some ley for Potatoes, but it is deeply engaged for the present, so we shall have to wait. The late harvest has caused a big demand for the use of cultivators on fallows. The ram must be separated from the ewes now, and the latter may be allowed to consume the Mangold tops; as there is likely to be plenty of other keeping; we should prefer to plough them in. They are worth more as manure than as food. The ewes will be best kept on grass or seeds at present; they are better without many Turnips until nearer Christmas, but they must not be put on very low-lying wet pastures until there has been a decided frost. The very mild autumn has been most favourable to the breeding of that dreadful pest, the liver fluke. A plentiful supply of rock salt might prevent the absorption of the embryo fluke, but would not kill it when once acquired by the system.

A swampy place sometimes causes an attack of fluke in what is otherwise a dry field. If a good dressing of agricultural salt were sown on the swampy place in July it would be an excellent preventive.

# PLANT NOW. CLIBRANS

## SPECIMEN HOLLIES For Immediate Effect.

WE hold perhaps what is the finest stock in the country of

## SPECIMEN HOLLIES

Perfect in contour and outline, well furnished with strong, stout foliage, in many cases down to the ground-line, and possessing an abundance of fibrous root; they cannot fail to move successfully provided ordinary care is exercised

### WE INVITE INSPECTION.

**ILEX AQUIFOLIUM.**—Grand plants, splendidly furnished, 6ft. to 9ft., 8/- to 15/- each; 90/- to 170/- per dozen. A few extra large specimens, price on application.

„ **AQ. ALTA CLARENSE.**—An effective, very hardy, smoke-resisting variety, splendid specimens, 6ft. to 7ft. in height, 12/6 to 15/- each; 140/- to 170/- per dozen. Extra fine, 21/- to 42/- each.

„ **AQ. ARGENTEA ELEGANTISSIMA.**—A very ornamental, silvery-leaved variety, grand specimens, 6ft. to 7ft., 21/- each.

„ **AQ. ARGENTEA MARGINATA.**—A robust, free-growing, silver-leaved variety; very hardy, and resists smoke well. Splendidly furnished specimens, 6ft. to 8ft., 12/6 to 17/6 each. Larger specimens, 21/- to 63/- each.

„ **AQ. HODGINSII.**—A grand, vigorous, smoke-resisting variety, perhaps the hardiest of all the Hollies, 4ft. to 5ft., 7/6 to 10/6 each; 84/- to 120/- per dozen. We have a limited number of extra fine, broad, and heavy plants of this height, splendidly furnished, at 12/6 and 15/- each; 5ft. to 6ft., at 10/6 and 12/6 each, 120/- and 144/- per dozen; 6ft. to 7ft., 15/- and 18/- each, 160/- and 190/- per dozen. Larger specimens, 21/- to 63/- each.

„ **AQ. LAURIFOLIA.**—A fine grower, and makes a splendid specimen, 6 to 8ft., 12/6 to 21/- each. Extra fine specimens, 31/6 to 63/- each.

„ **AQ. LAURIFOLIA NOVA.**—A good fruiting variety, of robust growth and good habit. Fine plants, 2½ to 3ft., 5/- each, 50/- per dozen; 3 to 4ft., 7/6 to 10/6 each.

„ **AQ. LUCIDA.**—A fine, silver-leaved variety, of compact habit. Fine specimens, 7/6 to 42/- each.

„ **AQ. MADERENSIS.**—Large, broad, spiny foliage. Fine specimens, 7/6 to 25/- each.

„ **AQ. MINORCA.**—Flat, shining foliage, makes a splendid specimen. Grand plants, splendidly furnished, 6 to 7ft., 10/6 each; 7 to 8ft., 12/6 each; 8 to 9ft., 15/- to 21/- each.

„ **AQ. SPECIOSA.**—A grand golden-leaved variety, of robust growth and constitution. Fine plants, 5/- to 7/6 each; extra fine, large specimens, 10/6 to 105/- each.

**STANDARD GOLDEN AND SILVER WEEPING HOLLIES** can be supplied at 12/6 to 21/- each.

## CHESTER

Great Private Sale.—Removing.—Estate Sold.

In Quantities and Selection to suit Buyers.

## FRUIT TREES.

40,000 VERY CHOICEST KINDS.

(Standard, Pyramids, and Wall-trained) Apples, Pear, Cherries, Peaches, Plums, and Damsons. 190 kinds.

An opportunity like this has never occurred for intending planters to secure such splendidly grown, transplanted, carefully pruned fruiting trees. No starvelings or old stunted rubbish, but cultivated for tenants. See Catalogue for doz. or 1000, how and what kinds to grow. The trees average 5 years old and just ready for removal. Thousands Currants, Gooseberry, Raspberry and Strawberry, Shrubs, Roses, and Rhododendrons. All young and guaranteed true to name. 10,000 Filberts, 5ft. high, very bushy and been transplanted.

**J. P. JONES, Churchfield Estate,  
CRADLEY, near MALVERN.**

## Journal of Horticulture.

THURSDAY, NOVEMBER 27, 1902.

### Soils: Their Treatment.

**N**OTWITHSTANDING all that has been written on the above subject, there is in actual practice much diversity in the methods adopted by different cultivators, and although each may secure good results by following practices widely opposed to each other, there must still be a practice, though not always the same one, which is the most suitable for each set of circumstances; and the aim of all cultivators should be to pursue a course which proves to be both efficient and economical. Hosts of cultivators have proved by experience the value of throwing up a stiff soil roughly during the autumn or early winter, because under the action of frost, rain, and drying winds, a soil so treated will crumble to dust by the spring, when, with a little surface culture, it is quickly brought into a suitable condition for sowing or planting.

This pulverising influence of frost is made clear by the light of science, which shows that between each particle of soil there is a tiny drop of water, which, under the influence of frost, expands, and thus forces the particles of soil further apart. When the thaw takes place, and the ice is again converted into water, there is a shrinkage, and air rushes in to fill up the vacuum. As the moisture dries out, more air is admitted, this in turn being again displaced by water, and thus the continual expansion and contraction going on works in a silent way a mighty wonder with Mother Earth.

If, then, the practice of throwing up a stiff soil roughly during the autumn tends to pulverise and bring it into a finely divided state, it is obvious that a similar practice is not the best one for a very light soil, because the object of the cultivator in the latter case

**R**EADERS are requested to send notices of Gardening Appointments or Notes of Horticultural Interest, intimations of Meetings, Queries, and all Articles for Publication, officially to **"THE EDITOR,"** at 12, Mitre Court Chambers, Fleet Street, London, E.C., and to no other person and to no other address.

should be to make it closer in texture, and thus more capable of holding the food of crops. Notwithstanding the above facts, there are, however, some able cultivators who practise, and strongly recommend to others, a course of procedure diametrically opposed to that outlined above. They say that it is only light soils that should be dug during autumn; the heavy ones they prefer to dig or trench just before planting is done in spring; advancing as their reason for such a practice that the freshly turned up heavy soil dries quicker, and is ready for sowing or planting at an earlier date than that thrown up in the autumn.

There is a good deal of truth in this assertion, and if it was only a question of getting the soil dry quickly some advantage might be claimed for late digging; but here the crux of the whole matter comes in, because by allowing a stiff soil to lie undisturbed till spring the influence of frost as a pulverising agent is entirely neglected. A stiff soil thrown up roughly in the autumn absorbs and retains a great amount of moisture, and the greater amount it retains the more beneficial will be the action of frost upon it. The surface may take a few days longer to dry in spring than in the case of a soil recently dug, but when the former is dry it crumbles to a fine powder, and a little hoeing and forking soon brings it into a fine condition of tilth.

Matters are far different with the spring-dug, stiff soil. After being turned up, the lumps dry quickly, but as no pulverising influence has been at work, the crumbling condition is entirely absent. The lumps when broken up are still lumps, though smaller in size, because the particles of soil have not been forced apart. In such a soil the tender roots of seeds are unable to work freely, and although after a time it crumbles on the surface under the influence of weather, that influence is only exerted to the depth of an inch or so, and the mechanical condition of the soil, instead of being improved each year, remains stationary.

In conjunction with this autumn cultivation, if the manure applied is used in a rough, fresh, undecayed condition better results are obtained on a stiff soil than when well rotted manure is employed. But in the case of light soils dug in spring, the manure should, of course, be thoroughly decayed, or if not the rougher portions ought to be removed. The old practice of burning the surface of a stiff soil is perhaps the quickest method of all in bringing it into a good working condition; but unfortunately it is not often practised now on account of the expense and the general scarcity of labour. Liberal application of lime or soot will also do much toward bringing about the amelioration of a stiff soil, in addition to supplying essential plant foods.

In regard to the best methods to adopt in trenching soils, there are still not a few misleading statements advanced by men who claim that such ideas have been forced upon them by the result of their own experience. Let us examine one of those ideas, and see how misleading it may become if advanced for general acceptance.

A prominent cultivator may be noted for the excellence of his vegetables, or crops generally. He attributes his success to the systematic practice of trenching, and in talking or writing of trenching advises that when that operation is performed the position of the soil should be reversed—burying the surface soil, and bringing that from beneath to the top; and if a word is said against the practice, points to the results he obtains by following it, quite ignoring the fact that a practice which may be right in his case would mean disaster if followed under other circumstances. Land which has been well manured for years, and trenched at regular intervals, after a time becomes very uniform in character from top to bottom. Then if at trenching time the position of the soil is reversed during the operation it gets considerably "mixed," and that brought up from below being fully charged with plant food, is improved by full exposure to the atmosphere, and the practice of continually reversing such soils brings them into that condition in which almost anything will grow in any portion of the soil down to the cultivated point.

Now, let us turn to the other side of the question. How could anyone more easily court disaster than by attempting this reversal of soil on land which had not previously been trenched, and which, although good on the top, is poor, sandy, gravelly, or stony beneath? Such a soil is, of course, immensely benefited by being trenched and heavily manured,

provided the inferior soil is kept beneath and the good on the top.

After a few years in a case of this description a little of the soil in the second strata may be mixed with that immediately above it, and thus by degrees the whole is improved to a great depth; but it is slow work, and the man who attempts to improve it at one bold stroke lays a "lash" on his own back which will cut deeply, and provide "stinging pin-pricks" for years after the "stroke" is driven home.—H. D.

## The Horticultural Hall.

Some of the plans for the Royal Horticultural Society's Centenary Hall are furnished on page 504, and these afford information of the selection, disposition, and sizes of the various offices and rooms, and of the exhibition hall. On the ground floor plan we observe that the site extends in front, facing St. Vincent's Square, to a length of 150ft, while the sides are almost 130ft.

This space would seem to be sufficiently extensive for the purpose of a suitable exhibition hall with offices for the fortnightly meetings of the Royal Horticultural Society and of the London special floricultural societies, but the question has arisen whether the best use has been made of the space. Three distinct committee rooms are provided on the first floor. Plants and objects for the respective committees will therefore, we presume, require to be carried up one storey, and down again, necessitating the expenditure of much time and energy. Might not the annexes of the exhibition hall have been utilised as places for the committee meetings, the duration of which is seldom longer than one hour in each fortnight?

This would have freed three rooms, or the space of the same, to be placed at the option of the Gardeners' Royal Benevolent Institution and the Royal Gardeners' Orphan Fund, with one room for the occasional meetings of the committees of the floricultural societies, each contributing a small rent for the use thereof. Failing the acceptance of these societies of the rooms, a club room would surely have been welcome. This would then appear like the true Home of Horticulture for which so many have been waiting, and become a source of revenue to the Council.

The external appearance of the hall, as shown in the plans approved by the Council, is such as to excite some feeling of alarm that this projected building may be sanctioned and completed without alteration, and stand for ages as an everlasting cause of lamentation to all who are lovers of the stately or elegant in architecture. Inasmuch as space is limited, every effort of the Council should be directed toward increasing the utilisable area in the basement, and creating more space in the roof. By the addition of a five-foot parapet, the attics of the hall could most easily be converted into a domed or skylighted museum, by which the outward semblance of the building would be completely revolutionised and beautified.

A museum appeals to us imperatively as an indispensable adjunct of a Royal Horticultural Hall. It may be said that a society distinguished by the possession of a Scientific Committee would find itself lacking in dignity if it could not also boast of a museum in which objects of interest characteristic of the deliberations of such a body might be accumulated. It is quite conceivable that hereafter the labours of this Committee will result in an accession to the Society of models relating to fruit, specimens of plant diseases or of injurious insects, and other interesting objects transmitted by enthusiastic Fellows during their migrations in foreign lands. In case the glazed and vaulted chambers on each side of the caretaker's apartments remain unused as a museum, it will not be difficult to find some other purpose for them, and the present unsightly roof of slate would disappear.

### Apple, Coronation.

We learn that the Apple named originally Edward's Coronation is hereafter to be named simply Coronation.

**Lælio-Cattleya × Bletchleyensis, Fowler's variety.**

This magnificent form was exhibited before the Orchid Committee of the Royal Horticultural Society on October 21, from the Treasurer to the Society, and received a First Class Certificate. Mr. Geo. Shayler's drawing below represents the natural size of the flowers. The sepals and petals are beautifully tinged

But with the best care some plants will suffer. The lovely *Phalenopsis* and the showy *Calanthes* are, perhaps, the most liable. The double roofed houses in vogue some years ago did little to check the damage, and it seems useless to try and prevent it. Any choice specimens or unflowered plants from which much is expected may have the shelter of a handlight in the house, a precaution that may, when the fog is of short duration, in some cases save the flowers. A dry state of the compost is of course beneficial, but this cannot always be arranged, as one is often tempted to water the plants on a bright sunny day, and the next morning may prove foggy.

Speaking of *Calanthes*, these useful and beautiful winter flowering Orchids are often injured by being stood about in cold, draughty corridors and conservatories while in bloom. They are natives of tropical countries, and cannot stand this treatment;

**Lælio-Cattleya × Bletchleyensis, Fowler's variety.**

and veined with rose-purple; while the lip is of a dark ruby-red tint, with lighter purplish margin.

#### The Week's Cultural Notes.

While all growers of Orchids are very much at the mercy of the weather, those residing within the metropolitan area, or within the vicinity of large towns, are seriously troubled with fog at this season of the year. I may as well admit that I have no panacea for the ills that Orchids suffer by this cause; but I have found that in many cases the injury done to the plants has been much worse when a very damp atmosphere has been kept up, and no attempt made to create a proper air circulation by means of gentle heat on the pipes and judicious use of the ventilators.

consequently, though no harm is apparent to the eye, the plants are checked and start weakly, and do badly in consequence. Moderately dry and warm conditions, without any moisture in the soil after the last leaf falls, is what they like, and opposite treatment is sure to be detrimental.

That beautiful cool house Orchid, *Disa grandiflora*, and its allies, are now growing freely, and should be encouraged. To dry it now is to weaken the young growth and cause it to be flowerless. It also tends to insect attacks. Should any of the later specimens appear to need more room, there is still ample time to repot; but should young roots be present use great care not to damage them. Offshoots potted up now stand a good chance of growing into flowering specimens; but no more time must be lost.—H. R. R.

### Wasps in Winter.

Yesterday, the 23rd inst., I was passing a spot in a meadow where in summer I found myself standing on the entrance to a strong colony of wasps, and soon found out the reason of so many around me requiring to obtain admission to the nest. The hole was covered with Oak leaves, and I brushed them away, and with the aid of a strong stake from the hedge I worked away the soil a good distance round, and took out the nest complete, about the size of an ordinary football. I was surprised to find still a large quantity of ordinary workers in the nest somewhat benumbed from cold and wet, but on being placed in a newspaper they by degrees assumed their normal character and flew away, but did not attack me as would have been the case earlier in the season. I did not notice any queens or male wasps, which have no doubt deserted their home, the queens no doubt hibernating in the vicinity. I find that their favourite resort for winter quarters is under dead bark on trees, sufficiently loose to crawl under. I found about a dozen on a tree some five or six weeks ago, and on the same tree last winter a youth killed about two dozen. On another tree I took about a score of queens from under loose bark.—JAMES HAM, Astwood Bank.

### Illegal Showing.

It will surely seem pretty plain to most readers of the Journal what is to be done to stop the dishonest practices of which "A Yorkshire Grower" complains, page 472. In most cases of fraud the difficulty is to catch the perpetrator; but there is rarely any trouble in knowing how to deal with him when caught. Now, two or three such people "A Yorkshire Grower" actually knows of, and of course he is prepared to prove it, or he would not say so. Well, it will seem to a good many of us "living down South" that if he does not expose these persons and bring them to justice a considerable and weighty responsibility at least will lie upon him. He thinks "the time has come when all such practices should be put a stop to"; but, according to his letter, he ought to have thought so for a year or so at least. This is not the first time that exhibitors "living down South" have heard whispers of lax proceedings in the North, and even that they are winked at and condoned. Indeed it is, as was the case with an example brought before the Journal some time ago, entirely a matter of schedule. Each show or society makes its own laws and rules, and it is impossible for any outsider to dogmatise about law-breaking till he knows what the rules, written or unwritten, may be. But if anyone knows of, and is able to prove, any showing which is illegal and contrary to the rules, it seems odd that he should have any doubt about what his duty may be.—W. R. RAILLEM.

### A Dissertation on Pears.

At the recent exhibition of the National Chrysanthemum Society it was a great pleasure to note how well-filled were the three classes for hardy fruits. Perhaps when the Royal Horticultural Society possesses a hall of its own it may then arrange to hold a late exhibition of hardy fruits. The exhibition held at the Crystal Palace is not enough, as it does not represent our home-grown fruit in all its possibilities, and London as a centre is much more convenient than Sydenham. With a proper place in London, the Royal Horticultural Society could give the public an exhibition of hardy fruits early in September and another early in November. The first would bring out the early varieties, and the later exhibition would prove the quality of fruits in season. It must be gratefully acknowledged that this Society has done much for the enhancement of hardy fruit culture, and it can do more, which, judging by the past, it will. It has drawn up a list of the most suitable Apples for dessert, and another for cooking. These may not find favour with everybody's choice, but it is a great aid to exhibitors, and it would be almost a blessing if the Society could, or would, arrange like lists for Pears and Plums.

Pears especially require defining, for with the present selection of choice dessert Pears nobody would think of sending General Todleben in for dessert, yet it is allowed for exhibition amongst fruits defined as follows:—"Dessert Pears, fit for table." General Todleben is essentially a stewing Pear, and as such it should be exhibited. With Pears as a topic it is difficult to stay one's pen; as a subject, there so much to say about them, and so much more to know! Several years ago I made

the acquaintance of the Pear Madame Treyve, and every year since have wondered, and wondered hard, why Madame Treyve is not more generally grown for market. Experience proves that there is room for such a first-rate early Pear, and if it pays to grow such rubbish as Beurré de Capiaumont, surely it will pay to grow a fruit which everyone can enjoy. I have such faith in the Pear that I am sure when it becomes better known it will be a leading early market Pear. Properly graded, it is quite capable of holding its own against anything in its season. Madame Treyve does not grow to a large size, but size extraordinary is not a market requirement.

That brings me to another point. At exhibitions we find Pitmaston Duchess always takes a prominent position in all its ponderosity. Now, it is not of the first quality, and its great size does not make it a desirable fruit for dessert. In a class devoted to the variety it is well and good, but amongst first-class dessert Pears truly there are many which beat it. Could not the same body of men who arranged the size for dessert Apples arrange and make law, a fitting size for dessert Pears? It would greatly benefit the exhibitor, and would make popular some most deserving varieties.—H. A. B. JOHNS.

### Apple, Tamplin.

Apple Tamplin, or Cissy, was raised about 150 years ago by a Mr. Tamplin, who lived at Malpas, a small village about three miles from Newport, Mon. Evidently he knew the value of it, as during his lifetime he distributed grafts amongst his many friends, and after his death his sister, or daughter, I am not quite certain, but am inclined to believe it was a sister, named Cissy, continued to distribute grafts, and thus it came into general cultivation in the Newport, Chepstow, and Monmouth districts. Unfortunately, there are no young trees to be found now; in fact, the greater part of what is left are very old trees, but I hope to be able to again bring it into general cultivation. I may say reference is made to Tamplin's house in Cox's "History of Monmouthshire," a book written about 100 years ago, which points to the truth of my statement as to the time of its being raised. I am making further inquiries in the parish in which he lived, but unfortunately the parish register only dates back to 1813; but I intend to carefully examine the tombstones to see if I can find any record of his death. I may say I have collected twenty or more old seedling Apples, which I am propagating, some of which have a history which will have to be told a little later.—JOHN BASHAM, Bassaleg.

### Cankered Apple Trees.

I hasten to tender my best thanks to "J. E. A." for his kind reply to my query about the above subject. The information given is so clear and convincing that I have no doubt many besides myself will speedily tackle any cankered trees they have control over. In one respect "J. E. A." bears out a point I have noticed, viz., that cankered trees do generally bear, but then it seems that the fruit is "mere rubbish" when compared with that gathered from healthy trees. Ah! I see, there is the point. England has enough "rubbish" already, but she wants more good Apples. The cankered trees ought to be cured then quickly. The next time I meet my gardening friends, or I should say gardening-loving friends, we will try and stir to action the owners of cankered trees in our village. By-the-by, a newcomer has arrived at a small farm just outside the village, and he seems like stirring us up a bit by the way he is going to work. He has been digging and delving and ploughing and harrowing with a vengeance during the last few weeks in order to get a good stretch of land ready for planting fruit trees. Some of the villagers look on askance, and tell him that fruit trees won't do in our neighbourhood because it is not a fruit-growing district; but he only laughs, and says he knows what he is about; all fruit-growing districts were without fruit trees at one time, and that there are still as good fish in the sea as ever were caught. Some day, he tells us, our village will be reckoned among the fruit-growing districts. One old man shook his head suspiciously at the latter remark, and asked the newcomer what he was going to do with all the fruit when the trees came into bearing, because he said they had too much fruit in some places now, and had a job to sell it. The busy man smiled again, and replied, "We have never yet had too many good Apples in this country. Why, man," said he to the old unbeliever, "do you know that last month over 640,000 cwts of Apples were sent to England from foreign countries? And yet I think I can grow Apples quite as good as any of them on this land. And I expect before long some of the rest of ye will want to plant too. Anyhow, as long as Apples sell as well as they do, I shall keep planting as fast as I can get the money." I have thought of the newcomer's words a good many times since, and there seems to me to be a good deal of sense in his method of reasoning. I shall try and cultivate his acquaintance, and who knows, perhaps I shall blossom into a big Apple grower yet, though at present I am only picking up such crumbs of knowledge as fall in the path of an—IGNORAMUS.

### National Chrysanthemum Society and its Management.

Having read the few lines contributed to your valuable Journal, page 432, of November 6, by "A Country Member" regarding the Society's judges, I can, with others, fully agree with "A Country Member." The management of the N.C.S. is far from being carried out in a fair manner. Being an exhibitor of cut blooms at the Society's Show held on November 4, 5, 6, I was more than surprised at the unfair way in which some of the exhibitors are treated. Surely the committee can find, as "A Country Member" suggests, competent judges outside of the committee to adjudicate at what is looked upon as the leading Chrysanthemum exhibition of the country. Why does the committee allow the judges to view the exhibits and interview the exhibitors before the time of judging? Many of the members of the committee are exhibitors at the exhibition of the Society. They select their own judges, and make their own rules. Rule 9, page 64, of the N.C.S. schedule, reads:—"Exhibitors must leave that portion of the building allotted to the exhibition at eleven o'clock unless officially retained by the Show Committee." Rule 8 states that all exhibits for competition must be staged by 11 a.m.

Having staged my blooms in good time, I had a walk round the Aquarium. Having had a look at Mr. Godfrey's stand of novelties, I came across one of the decorative displays of the fountains, which was awarded the third prize, so I walked to the other end of the Aquarium to find the first and second prize winners. To my surprise, these first and second exhibits were unfinished, the exhibitors being still very busy completing their displays, the time then being 12.30, so I patiently awaited until 12.45, when the judges made their award. The first-prize winner was again Mr. Norman Davis, who is to be congratulated on his grand display, also on being the happy possessor of the same fountain he has obtained for three years in succession, which is the best-lighted position in the Aquarium. Now that the N.C.S. is seeking a fresh place of abode, let us sincerely hope there will be a change in its management, so that exhibitors, amateurs, and members of the trade, may each receive just and fair awards.—F. W.

### Culinary Peas.

The weather during the past season has been so very trying to most crops that it is interesting to note that Peas have done especially well; at least, such is my experience here. Commencing with the early section, we made our first sowing in turves in the following varieties:—William Hurst, Sutton's May Queen and Sutton's Little Marvel, placing the turves in a Peach house (which had just been started) on February 12. After germination the above were planted out on a south border on March 11. We commenced gathering from them on June 30; William Hurst and May Queen being ready a couple of days in advance of Little Marvel. I may mention that the weather was very cold during March, April, and May, and we had to cover the above every night with tiffany.

Our second sowing was made outdoors on a south border in front of a Peach house on March 3, the varieties being William Hurst and Sutton's May Queen. They were ready for picking only a week later than our first sowing in turves. Our next sowing was made on March 29, on ground recently occupied by Celery, the variety being Sutton's Early Giant. They came into bearing on July 6, and a finer lot of Peas I have never seen. It is a very free cropper, the pods bearing on an average ten peas in each, while several contained eleven. The flavour is all that can be desired, and it is, in my opinion, one of the finest Peas yet introduced. Following the above we sowed, for succession, at periods varying from a week to a fortnight between each, these:—Sutton's Telephone, Duke of Albany, Selected Telegraph, Sutton's Invincible Marrowfat, Sutton's Satisfaction, Sutton's Dwarf Marrowfat, Walker's Perpetual Bearer, Autocrat, Selected No Plus Ultra, and Sutton's Latest of All. The last three varieties were sown on June 27 on ground which had been dug and manured as for ordinary crops, and we have been gathering nice dishes from them up to the present month, our last picking being on the 5th inst.

Needless to say, Peas at this time of year are much appreciated by my employer, and should frost not visit us for another week or two, we shall be able to gather a few more dishes. Among two or three varieties received for trial, Sutton's Centenary turned out the best, and I shall certainly grow it again. From the end of June, when we gathered our first Peas, we were able to gather Peas every day without a break at the rate of half a bushel a day up to the end of September. Since then we have been able to gather quantities of about one peck about twice or thrice a week, according to weather. Our soil is heavy and retentive, on clay. This, combined with the satisfactory behaviour of our Peas during the past prolonged wet season, tends to prove that abundant moisture is essential to successful Pea culture. We have enjoyed almost entire immunity from mildew, our remaining rows of Peas still retaining their healthy appearance.—WILMOT H. YATES, Rotherfield Park, Alton, Hants.

### New Japanese Varieties.

Continuing my selection from p. 448, I have several more to recommend which I have quite recently had an opportunity of inspecting, and for the benefit of Journal readers give my experience.

CALVAT'S SUN grows to a large size, has long drooping florets, which curl at the tips, the weight of which seems to pull them down a trifle too much, so that the eye is not quite filled up. In colour it is golden yellow, just the colour to please.

MRS. W. PREECE is of medium size, has closely curling florets, which are split at the tips, they are also ribbed or fluted, which gives it a striking appearance. The colour is quite a deep yellow.

LADY CRAWSHAW grows to fully 8in in diameter, has medium florets, which droop and curl upwards at the tip, making up a full, bold flower. In colour the base is deep pink, growing lighter towards the centre.

MRS. S. FRYETT is fully 8in wide, and as much as 6in deep—a full, massive flower. The florets are broad and sword shape, semi-drooping. The colour is striking—a rich rose amaranth, quite one of the best of new varieties.

MISS ELSIE FULTON, although not quite new, deserves to be more generally known. In the North of England, and especially in Scotland, it has been remarkably well shown this season. It is a typical incurving Japanese, quite distinct from any other variety. The florets are broad, curling quite distinctly, not too closely united. The colour is the purest white, and the blossoms full and perfect in contour. I strongly recommend this variety.

PRINCESS DE BRANCOVA, although not quite new, deserves to be better known than it is at present. In general appearance it resembles Mrs. J. Lewis, but has much longer and more graceful drooping florets of the purest white. A bloom of this variety, fully 9in deep, won the premier award at the late Edinburgh show for the best Japanese.

EDITH SHRIMPTON in colour is a soft pink at the base, paling to pure white in the centre. The florets are broad and long, and curl at the tips after the Dragon style.

W. DUCKHAM is much the best new variety of the incurved-Japanese section seen for a long time. The broad incurving florets are deep rose pink in colour, of perfect form, and "build." This is an English raised variety from Australian seed.

COL. WEATHERALL belongs to the incurving Japanese section, with extra broad petals, which incurve perfectly. The colour—apricot-bronze—is pleasing.

WILFRED H. GODFREY has flat reflexing florets, rich crimson on the surface, and a gold reverse; quite a promising novelty.

HAROLD is another incurving Japanese, with a golden chestnut reverse, and an apricot rose surface where this can be seen.

DUKE OF DEVONSHIRE belongs to the giant class of Japanese varieties. The narrow florets have a curious twist. In colour the base is yellow with a rose suffusion, with a golden centre.

ETHEL FITZROY grows rather above medium size, the narrow florets reflex and droop at the tips. The flower is especially well built up. The colour is pleasing, a rich orange amber shaded with reddish crimson.

BESSIE GODFREY I look upon as quite one of the best of yellow flowered Japanese. The medium sized florets droop slightly, and with a graceful curve. The blossoms are especially well built up. The colour, clear yellow, deepens towards the centre. No matter how small the collection this variety should be included.

GUY HAMILTON may not be quite new, but it deserves to be much better known than it is at present. Where a full and broad blossom is required for exhibition this variety should be grown. The florets are long, drooping, and curl at the tips. The colour is pure white.

LILY MOUNTFORD has been exhibited in such magnificent condition this season that its merits should be more widely known. It has all the attributes that go to make up a typical Japanese blossom. When at its full size the blooms measure 8in in diameter. The true reflexing florets are creamy white in colour, heavily flushed, and striped with rose.

MRS. VALLIS is a dark terra cotta red, with a golden reverse. The florets are of medium width, droop, and curl slightly at the tip.

LADY ACLAND is 9in in diameter, and fully 5½in deep. The florets are broader than in the case of G. J. Warren, are split and forked at the tips. The centre of the flower is orange yellow, paling with age to a lighter shade. Quite a promising variety. (Jones).

SIR W. ACLAND has florets 7in long, fully developed blooms measure 10in in diameter. The broad irregularly twisted florets droop gracefully. The colour is a yellow base, edged, striped, and speckled with crimson. (Jones.)—E. MOLYNEUX, Swanmore.

#### Chrysanthemum, W. R. Church.

In the above we have a variety first exhibited at the Melbourne (Australia) Show in April, 1900, where it was awarded the Silver-gilt Medal as a novelty. It was also the winner of the Silver Medal at Edinburgh in November, 1900, as the best novelty, and F.C.C. at twelve other exhibitions (including the Paris Exhibition). It is now the most popular variety in existence. It was named after the wife of the secretary of the R.H.S. of Melbourne. Regarding the culture of W. R. Church, cuttings are best inserted about Christmas. Grow the plants on to their natural second crown bud, which generally appears about the middle of August. The plants will stand a good amount of feeding after the buds are as large as peas, and they should have a little sun and warmth, then the florets reflex, otherwise they are incurving; take three flowers for a 10in pot.

It is also one of the very best for 6in pots. For this size, insert the cuttings in March, stop when 6in high, then let them make one natural break, and secure the next bud, one flower to a pot. We have some splendid flowers now (November 25) grown this way, one of which is enclosed. [A really handsome flower.—Ed.]—W. W.

#### Chrysanthemum Mrs. T. W. Pockett.

The above popular variety was awarded the Wells Gold Medal in Melbourne in April, 1901; also the Silver Medal in Edinburgh in November, 1902, last for best novelty. This variety has been disappointing to all those who would not wait for second crown buds. It requires much the same treatment as W. R. Church, and should be treated the same. For 6in pot plants it beats even that noble variety. It is without doubt the most refined flower up to date, and those who have had the pleasure of seeing the splendid specimen plant which was exhibited at Manchester Show a few days ago will see at once the value of it for such purposes. It is a good match for, even if not better than Nellie Pockett, and those who have seen the two at Earlswood consider it the very best in the collection.

#### Chrysanthemum, W. Duckham.

This is a beautiful deep mauve-pink variety, Japanese-incurved, exactly the colour of N.C.S. Jubilee. This was the Silver Medal winner at Edinburgh this year, and was raised from seed which Mr. Pockett sent to Earlswood about Christmas, 1900, and was selected as one of the best when Mr. Pockett was here last year (1901). It has a wonderfully strong constitution, and requires stopping early in April to secure second crowns, otherwise the treatment is as for the other two. I merely mention this variety as it is the third Silver Medal (Edinburgh) winner, and must become as popular as the two others already named.

#### Chrysanthemum, S. T. Wright.

This is without doubt the most beautiful and I am sure the noblest of all the novelties Mr. Pockett has ever sent out. When I asked Mr. Pockett if he could not possibly send me a crimson Mrs. Barkley, he said: "In K. 20 you have your ideal crimson Mrs. Barkley." That told me enough, for Mr. Pockett does not waste his words, and this

was all he said to me about it. This was last May (1902), after they had flowered in Australia. We had but very few plants of it, and one only was stopped in April, which produced the magnificent blooms for which the Royal Horticultural Society gave the Award of Merit. The first crown buds were too late in opening, as they were packed too full of florets. The second crown buds were a little too late, although quite full; but even these would have been grand had they been placed in the sun, or in a house a little warmer; but, being a crimson, we naturally shaded them, and this was a mistake. It requires stopping early in April, and secure second crowns, and I shall not be surprised to see it quite as large as Mrs. Barkley, but with perhaps not quite such long florets. It will keep longer in good condition, however, than Mrs. Barkley, or any other variety, and will not damp, as it has such thick florets.—W. W.

#### N.C.S., Its Early History.

Respecting the National Chrysanthemum Society's early history, referred to by me on page 449, just one mistake, I thought I had better apprise you of it. Sir E. Saunders only became connected with the N.C.S. during recent years, whereas Saunderson, of Hackney, formerly presided. He died years ago; he was a 'cute old chap and grower, regularly taking first prize for incurveds, and was a very attractive speaker.—H. CANNELL.

#### Chrysanthemums at Regent's Park.

From conversation occasionally heard in various quarters, it seems evident that "things are looking up" at the Botanic Gardens, Regent's Park. This is certainly correct in regard to the Chrysanthemums, which I found effectively arranged in the large conservatory, with backgrounds of foliage. In the Japanese section might be noted blooms of Ella Herxheimer, Kate Howard, Mrs. G. Mileham, Charles Davis, Miss Alice Byron, Frances Connor, T. Carrington, Mrs. Barkley, and N.C.S. Jubilee, all of them good. Of the incurveds, Chas. H. Curtis is undoubtedly considered one of the most satisfactory, and several plants were to be seen. Col. Baden Powell, Golden Madame Ferlat, Louisa Giles, Ada Owen, Baron Hirsch, and others were also conspicuous.

A very pleasing effect was obtained by having tall plants of Margot (grown naturally) lightly springing from the upper portion of a large bank of foliage, with several plants of Lady-smith (single) and a few others of various sections furnishing the base. On our way to inspect the later plants in the growing department, two fine plants of Musa Cavendishi were noticed, and alongside of which was the Crinum exhibited earlier in the year at the Drill Hall, again bearing a magnificent spike of nearly three dozen flowers. Structural repairs and painting are also proceeding apace; and, I understand, the Council of the Royal Botanic Society have recently passed a vote of thanks to Mr. E. F. Hawes, the head gardener, for the very satisfactory manner in which he is carrying out the much-needed work of renovation.—R.

#### Mr Molyneux's Selection of Japs.

As a reader of the *Journal of Horticulture* I think I have a right to give a word of praise to that noble writer Mr. E. Molyneux for the different times he has written for it, and especially for his annual selection of novelties, but was sorry that he gave us (page 448) no white one. I would like to ask Mr. E. Molyneux (if it is not asking too much?) if he minds giving us his opinion of a few more novelties, as I think he has a bit of thought for us poor countrymen who have not the privilege of seeing them when they first appear. If we had the chance, I am afraid that there are a lot of varieties that would not be grown though they have received an award of merit; but as I had the privilege of seeing two dozen blooms exhibited by a noted distributor of Chrysanthemums, I took the names of seven that I thought were the best, so I will give these names:—Mrs. J. C. Neville, Mrs. Jarvis, Viscountess Cranforth, Edith Smith, General Hutton, George Lawrence, and Miss Mildred Ware. The last one named I see is recommended as a good one. Seeing that we have three noted distributors, I should deem it a great favour if Mr. E. Molyneux will select about eight distinct colours from novelties sent out by the three firms, Wells, Godfrey, and Jones. And if it is not too late for the Chrysanthemum analysis, I should like to make a suggestion which I think would lift some of the novelties higher up in the list. Look in last year's analysis and you will find that Lord Ludlow stands at number 20, and Sir H. Kitchener at 27, and as seen by me this year on the same stands, I think it should be six for one and half a dozen for the other; so if this catches the eyes of the gardeners who are giving their votes I trust they will consider the points of merit of each variety well.—O. L., Rotherham, Yorks.

### Rose Analysis: Bessie Brown, H.T.

Readers of the Journal, seeking to learn from Mr. Mawley's painstaking analysis the best Roses to plant in their gardens, should not be led astray by the premier position occupied by Bessie Brown in the long list of exhibition H.P.'s and H.T.'s, to plant it largely for any other purpose. It is an indispensable and most reliable Rose for exhibition, but is almost useless for the general grower. This is not because it is delicate, weak in growth, difficult to manage, or shy in flowering, for it has none of these faults; but simply because it hangs its head so much that it cannot be seen or admired unless the stem is wired. It is very much in its favour that it is possible to wire the stem. There are several Tea Roses which are apt to have crooked flower-stalks, the weight of the bud dragging it down while the stalk is yet pliable, and most of these have stiffened and hardened in their crooked state by the time the flower is fit to be cut, and then it is a difficult matter to wire them at all. Maréchal Niel is an offender in this respect, and Empress Alexandra of Russia is the worst Rose I know for crookedness of flower-stalk.

The stalk of Bessie Brown, however, immediately below the seed-vessel, remains pliable to the last, and offers but little difficulty to the anxious and hurried exhibitor. Nevertheless, the pendant flower very much detracts from its value for the ordinary cultivator. It does not matter so much with small garden Roses, of which you gather a bunch in all stages, and which are more dependent for beauty on their habit and colour than on the form of the individual blooms, if at certain stages of development they do hang their heads. But Bessie Brown is a very large fine bloom, whose beauty does depend upon its splendid form; the outer petals are likely to be somewhat discoloured, and if you cannot see its "face" the beauty is lost.

We do not want to have to wire blooms on the tree, or even in vases; and so, though I hardly like to describe Bessie Brown as "purely an exhibition Rose," I should strongly advise those who do not grow for exhibition not to plant too many of it.

Mrs. John Laing, H.P., though second to it in the analysis, is fifty points ahead of it at least in value for general use. Another H.T., Marquise Litta, which holds the high position of seventh in the analysis, is a difficult Rose to show well. Several times last season I saw it as quite the worst flower in the stand. It is very beautiful when quite young, but is apt very soon to become coarse in colour as well as form.

Another H.T., Killarney, which deservedly occupies a good place at No. 29, is a good show Rose of quite first-class form. This is one of the very few Roses which, sent out as "garden," have proved to be good show Roses. There are plenty of examples of the converse. It is not a good garden Rose, and does not appear in the analysis of that class at all; so we may hope that when the new N.R.S. catalogue is issued, it may be removed to its proper division.

None of the above remarks are intended as criticisms on Mr. Mawley's analysis, which only shows, and, no doubt, quite correctly, the number of times each variety has been shown at exhibitions of the National Rose Society. They are only meant to prevent one or two wrong lessons being learnt from it.—W. R. RAILLEM.

### Irish Rosarians.

Will you kindly permit a twenty years' correspondent of the Journal to express the pleasure felt in seeing the portrait of an old friend, Mr. George Dickson, sen. (page 474), and the accompanying kindly references last issue. Irishmen specially, north and south, feel a legitimate pride in a firm that has sent out fifty new Roses, vide last issue of their catalogue; and as the very interesting Rose analysis of Mr. Mawley shows (page 463), fourteen of those, Hybrid Perpetuals and Hybrid Teas, are actually among the sixty-six finest and most generally grown Roses in the world; and a similar proportion among Teas and Noisettes. When visiting Messrs. Dickson's nurseries some years ago, I ascertained that not one in a hundred of their hybridised seedlings can pass the trial before being sent out; and this gives an idea of the labour and care involved.—W. J. MURPHY, Clonmel.

### New Roses from Lyons.

PERLE DES NEIGES.—A Polyantha Rambler, having the appearance of Crimson Rambler, but with white flowers—a very remarkable plant. The foliage and habit are identical; its pectinate stipules indicate its origin. This variety is extremely floriferous, and bears corymbs of from twenty-five to thirty flowers till late in the season. The blossoms are *d'une blancheur éclatante*—a spotless, dazzling white, and expand well. This

variety was awarded a first-class certificate of the Lyons Horticultural Association on October 19, 1902.

BELLE CAPRICIEUSE.—A Tea, of medium height in growth, and having bright green foliage. The flowers are perfectly double, odorous, opening easily and well, the petals thick, coloured salmon-yellow above, and a rose shade on the reverse; the centre of the flower, when fully developed, is rose-peach. A variety of the first order. The beautiful variety Madame Martignier, which has received many awards this year, will be sent out this autumn, along with the two above named, by M. F. Dubreuil, Rose Grower, Route de Grenoble, 146, à Monplaisir-Lyon.—(From "L'Horticulteur Nouvelle.")

## Pruning Fruit Trees After Planting.

The question regarding the pruning back of fruit trees after planting is one that has often puzzled a considerable number of people. Some advocate planting and not pruning the first year, while others pin their faith on shortening back the first season. For my part, I consider the latter the best practice.

Why? I will endeavour to explain the principles on which this practice is founded, and leave it to the reader to judge as to whether it convincingly appeals to his reason. I will deal only with young and easily portable trees, because these are the kind of trees which are the most frequently planted to form fresh plantations. When a young tree is dug up from the soil in which it has been growing for a considerable time, it is seldom that it can be removed with the full complement of roots that it possessed previously. The utmost care may be exercised in lifting, but it is certain that a number of roots will be broken in the process, especially if they are thick roots, and extend to a distance. Fibrous roots lift readily because they are short, slender, and numerous, and are far the best; but it is not possible to ensure them in quantity on young trees without special treatment for a few years in lifting and replanting. The majority of trees, therefore, for planting have a reduced root system, owing to breakage in lifting, and further reduction by the necessary pruning back of the damaged roots.

It will be seen that the roots and branches are unevenly balanced, and according to the extent of root pruning so should the branches be dealt with. The less fibrous roots a tree has, the closer the pruning should be. Trees with sparsely furnished root systems require time to rebuild; consequently the energy which must first of all be utilised in recruiting the root power is not sufficient to induce vigorous growth over the whole of the original extent of branches, hence the desirability of shortening back. Pruning after planting does not necessarily mean immediate pruning, but before growths push in spring. It is always necessary to cut away unripe points of shoots, and this may be done before or just after planting; but the main pruning of newly planted fruit trees should be carried out just before the buds push in spring strongly, so that it can be seen where it is likely that the most promising shoots can be originated.

The advocates of non-pruning the first year say that the greater extent of leaf surface will increase the root power, and when the trees are shortened back the following year much better growth will result than if similar pruning was done the first year. This, however, does not necessarily follow, as if the roots are weak, energy will not be transferred over the whole branch system, and growths will either be weakly or die back. This is an effort of the trees to adjust themselves to altered circumstances. By pruning back the first year they are assisted to grow evenly and well balanced, and are in the right way to become fruitful in future years.

The general rule for pruning back the first season is to shorten to one-third or less, according as to whether vigorous growths are wanted to multiply branches. In reply to "Observer," on page 450, Cob Nuts should be cut back after planting, supposing the plant has a single stem, 2ft or 30in high. Shorten to 18in, and select half a dozen of the growths that push, which train at equal distances to form the tree.—E. D. S.

### Webster's Forester's Diary.

This book, which is neatly bound in limp leather, and contains half a page of separate writing space for each day of the year, with marker and note-tablet, is made additionally valuable by a complete list of the names and addresses of all foresters throughout the United Kingdom. Special information is supplied within the scope of its pages on thirty-nine subjects of particular interest to arboricultural circles. It is published by William Rider and Son, Limited, Timber Trades Journal Office, 164, Aldersgate Street, London, E.C., price 2s. 6d. net.

# NOTES & NOTICES

## National Dahlia Society.

**PRELIMINARY NOTICES.**—The annual meeting of the society will be held at the Hotel Windsor on December 16. The 1903 exhibition will take place on September 1 and 2 at the Drill Hall, Westminster. There will be a conference on the judging of Cactus Dahlias on the afternoon of the first day. Lord Ilchester has kindly consented to become a patron of the society. —J. F. HUDSON, Hon. Sec., Gunnersbury House, Acton, W., November 19, 1902.

## Royal Horticultural Society

The last meeting of the Royal Horticultural Society this year will be held on Tuesday, December 9, in the Drill Hall, Buckingham Gate, Westminster, 1 to 4 p.m. An election of new Fellows will take place at three o'clock. At a general meeting of the society, held on Tuesday, November 18, forty-four new Fellows were elected, amongst them being the Right Hon. Lord Hastings, the Right Hon. Lady Tweedmouth, Major F. G. Parsons, Major H. Ferry, and Captain Hineks, making a total of 1,089 elected since the beginning of the present year.

## Waterford Horticultural Society.

The annual general meeting of the above society was held on Thursday last, November 20, in the Council Chamber, Town Hall, Raymond de la Poer, Esq., J.P. (President), in the chair. The balance in the hands of the hon. treasurer, after payment of all expenses, to the credit of the society is £15 15s. 6d., showing an improvement over 1901. Mr. D. Cantmill, the much-esteemed secretary, resigned his office owing to the great pressure of other work, and carries with him the warmest regards of all the members.

## Presentation at Ballywalter.

On the evening of Thursday, the 20th inst., a very pleasant social function took place in the Lord Dunleath Arms, Ballywalter, on the occasion of a presentation to Mr. Edward Cole, who has been head gardener at Ballywalter Park for about six years. The proceedings took the form of a dinner and ball, and in regard to the former the catering by Mr. and Mrs. Blackburn gave the greatest possible satisfaction. Afterwards the Rev. W. Kerr, vicar of Ballywalter, was unanimously invited to take the chair. The loyal toasts having been cordially received, the chairman made the presentation. It consisted of a fine gold watch, which had an appropriate inscription. The reverend gentleman, in handing the gift to Mr. Cole, spoke in most flattering terms of his conduct and character. As they all agreed, the head gardener was most popular in the district, and was deservedly a general favourite among Lord Dunleath's tenantry.

## Shirley (Southampton) Gardeners.

Quite a change took place on Monday evening at a meeting of the Shirley Gardeners' Association, when money prizes were offered for cut blooms of Chrysanthemums with the understanding that the successful competitors should be called upon afterwards to give some account of their cultivation, and this resulted in an interesting discussion. The competition would have been greater but for the fact that the Shirley and Milbrook Horticultural Society are holding their first Chrysanthemum show on November 26. Mr. Shepperd (gardener to General Janner) was the winner of the first prize with exceedingly fine blooms. Mr. J. Biggs (gardener to General Nesbett) was a good second. The chairman (Mr. B. Ladhams, F.R.H.S.) called on Mr. Shepperd, who gave some useful hints on the cultivation of the Chrysanthemum. Mr. Biggs also gave his experience, while Mr. Jesse Jones, The Gardens, Terrace House, showed a thorough acquaintance with all branches of the subject. Other exhibits: Mr. B. Ladhams' dwarf Chrysanthemums in pots, vhc; Mr. Budd, a very fine dish of Beurré Diel Pears, vhc; Mr. J. Wilcox, Tritoma, hc. The next lecture will be given by Mr. Edwin Molyneux, V.M.H., on hardy fruit culture, with special reference to bush trees.—J. M.

## Coronation Trees.

Trees have been planted at the following places in commemoration of their Majesties' Coronation:—Frodingham, Scunthorpe, and New Brumby, Lines., on the 15th inst. Brass bands led the procession, and large numbers assisted at the planting at a minimum charge of 3d. each, the proceeds going to a local hospital. King Carlos of Portugal planted an Oak tree at Flemish Farm, Windsor, on November 19.

## Reading Gardeners' Association.

The fortnightly meeting of the above association was held on Monday, the 24th inst., and was well attended, Mr. F. Lever presiding. The subject for the evening was "All phases of pruning in connection with hardy fruit culture," this being the title of the first prize essay in the association's recent competition, and was read by Mr. C. P. Cretchley, The Gardens, The Honeys, Twyford, the successful competitor. The paper was of a practical character, and an interesting and profitable discussion followed, in which Messrs. Hinton, Wilson, Fry, Neve, Parfitt, Alexander, Exler, Iggulden, and Townsend took part. A splendid batch of Cyclamens was staged by Mr. F. W. Exler, The Gardens, East Thorpe, Reading; the plants showed splendid growth, and were full of flower. This exhibit was not entered for the certificate, but the members, to show their appreciation of the display, passed a special vote of thanks to the exhibitor. The subject for the next meeting will be "The Cultivation of Peaches and Nectarines," by Mr. W. Tribbick, of Brooke, Isle of Wight.

## Cambridge Gardeners.

The annual dinner of the Cambridgeshire Horticultural Society was held on Friday, the 14th inst., Sir Robert Ball presiding, and was supported by a large and distinguished company. In the toast to the society the chairman said that the horticultural society had been in existence since the year 1824, and it had had a most useful and valuable career. He visited the recent exhibition, and was immensely struck with the beauty, number, and variety of the exhibits. He could not but think that it was in an extraordinary degree creditable to the society, and indicative of the skill and energy with which the society's affairs were conducted, to have produced so fine a display.

## Ancient Society of York Florists.

The Chrysanthemum Show of this society is already fixed for the 18th, 19th, and 20th of November, 1903. It is also proposed to start a Dahlia Show, to be held, if possible, in the same building, on September 2, 1903. Beneath are given some figures and particulars relating to the society's finances during the last few years:

|       | Receipts at Chrysanthemum Show, 3 days. | Members' Subscriptions. | Prizes Awarded.  |
|-------|---|-------------------------|--|
| 1897  | £319 14 9                               | £174 12 0               | £278 7 3   |
| 1898  | 325 8 11                                | 174 12 0                | 262 3 9  |
| 1899* | 337 12 7                                | 184 17 6                | 319 16 9   |
| 1900  | 303 0 8                                 | 187 7 6                 | 284 11 6   |
| 1901  | 277 1 8                                 | 183 7 6                 | 287 3 9  |
| 1902  | 337 13 11                               | 195 18 0†               | 295 5 0, with slight addition for medals, &c., to be supplied. |

\* 1899.—Record for receipts.

† 1902.—Record for receipts beaten by 6d.

‡ Present Secretary held position for past four years. 1902 subscriptions include £5 5s. life membership from Lord Deramore, he being the only one.

## Cardiff Gardeners Association.

The usual fortnightly meeting took place at the Grand Hotel on Tuesday, November 18. Mr. C. E. Collier in the chair. Mr. W. Richards, hon. secretary of the Glamorganshire Bee-Keepers' Association, delivered a lecture, entitled, "Bee-Keeping," as regards (1). Feeders and Feeding; (2). Surplus Comb Honey and Run Honey; (3). Wintering. The lecture was one full of interesting and practical information, aided with illustrations of several useful appliances (both old and new). In giving recipes of a few kinds of feeding syrups Mr. Richards emphasised the importance of using pure cane sugar in each case. Also, he dealt at some considerable length upon the best way of manipulating the bees before extracting the honey, and again advising the best modes of wintering. Mr. Thomas Malpass (an old bee expert) very ably opened the debate, who could but endorse all that the lecturer had advised as being thoroughly practical, and this was also the general opinion of the members. At the conclusion a very hearty vote of thanks was accorded Mr. Richards for his instructive lecture, to which he suitably responded.—J. JULIAN.

**Cassell's Dictionary of Gardening.**

The eighteenth part (price 7d. net) has been issued, bringing the work down to *Ternstroemia*. The Dictionary will be completed in two more parts, and as it is a useful and very cheap reference work, young gardeners and others are commended to give it strict consideration.

**The Greenhouse, Kew Gardens.**

The following list of plants now flowering in the greenhouse (No. 4), The Royal Gardens, Kew, may be interesting as well as useful to those who endeavour to furnish a bright and varied display during autumn:—*Abutilons*, *Cyclamens*, *Chrysanthemums*, *Solanum integrifolia inermis*, *Salvia splendens grandiflora*, *Begonia incarnata*, *Funkia lancifolia* var. *tardiflora*, *Jacobinia (Justicia) magnifica* var. *pohliana*, *Statice puberula*, *Primula sinensis* in variety, *Primula Forbesi*, *Cyperus alternifolius*, attractive for flower, foliage, and stem growth; tree *Carnations*, *Angelonia salicariæfolia*, blue and white varieties; *Peristrophe speciosa*, *Eupatorium odoratum*, *Cannas*, *Primula obconica*, *Begonia Gloire de Lorraine* and its variety *Mrs. Leopold de Rothschild*; *Zonal Pelargoniums*, *Tecoma Smithi*, *Campanula isophylla* Mayi, *Rondeletia odorata*, *Campanula Loreyi*, *Celosia cristata* vars., *Begonia glaucophylla* (in a hanging basket), *Tuberose*s, *Calceolaria Burbidgei*, *Begonia coccinea*, *Acacia platyptera*, *Lilium Browni*, various *Epacris*es, *Bougainvillea glabra*, *Tropæolum Fireball*, *Plumbago capensis*, *Hidalgoa Wercklei*, *Maurandya scandens*, *Hibbertia dentata* (the last six as roof climbers), *Salvia azurea*, and *Begonia echinosepala*. The foregoing are not represented by merely one or two plants, but mainly by batches of from a dozen to twenty or thirty plants. *Chrysanthemums* are largely shown. The plants of different genera are not mixed on the stages, but each genus is placed to afford a massed effect by itself, or at most two genera are pitted in contrast.

**National Chrysanthemum Society.**

A largely attended meeting of the Executive Committee was held at the Royal Aquarium, Westminster, on Monday evening last, Mr. Thomas Bevan presiding. A letter was read from the President, Sir A. K. Rollit, M.P., who is now in the United States, regretting his inability to preside at the annual dinner, but expressing the hope he should be back in time to preside at the annual general meeting. The amount of prize money awarded at the November show was announced to be £330 9s., and a list of the medals awarded to miscellaneous subjects was also read. Certain protests against the decision of the judges at the November show were reported, which had been dealt with by the Arbitration Committee, and though it is set forth in the regulations that the decision of that body is final, one of their decisions was over-ruled by a vote of the Committee. A report was made of the amount of money subscribed to the Sir E. Saunders Memorial Fund, which the Secretary stated was only a little more than was required for the provision of one memorial medal. A financial statement was submitted, showing a substantial balance in hand, but a list of liabilities were recited of a somewhat heavy character. On the recommendation of the Finance Sub-Committee the sum of five guineas was voted from the funds towards the building fund of the new exhibition hall of the R.H.S. The following dates were fixed for the society's exhibitions in 1903, supposing, of course, the society will be in a position to carry them out on their present scale, viz., October 6, 7, 8, November 10, 11, 12, December 1, 2, 3. The dates of meetings of the Executive and Floral Committees were also fixed, subject to the same condition. It was resolved that the annual dinner be deferred until the spring; also that the Floral Committee be invited to dine as usual, the place and date being left to that body. It was resolved that a smoking concert be held on December 18, and a small Committee was appointed to carry out the same. The president having undertaken to revise the rules of the society, certain amendments suggested by him were read, and it was resolved they be considered at the next meeting of the Committee. An interim report was made as to certain places in which the meetings of the Committee might be held, and the same was referred to the Sites Sub-Committee. Nine candidates for membership were elected, including two Fellows.

**Gold Medal Fruit.**

Messrs. J. Peed and Son, seed and bulb merchants, Roupell Park Nurseries, Norwood Road, West Norwood, London, S.E., staged an exhibit of fruit at Birmingham Show on November 11 and 12, and were awarded a gold medal.

**Rugby and District Chrysanthemum Show.**

We understand that the sales at the flower stall conducted by the daughter and friends of Mr. William Bryant at the recent Rugby Chrysanthemum Show resulted in the sum of £7 4s. being sent to the Royal Gardeners' Orphan Fund. During the past dozen years Mr. Bryant and his friends have by similar means contributed no less a sum than £86 18s. 8d. to this charity, thus earning the grateful thanks of the committee and the orphans. We could heartily wish that all other societies holding flower shows would assist the fund in a similar way.

**Liverpool Amateur Gardeners.**

Although Chrysanthemum time, it was much to be regretted that they were not up to the usual mark, the twelve Japanese being secured by Messrs. Ellison and Thomas, Mr. Histed winning with three Japanese. For six incurved Messrs. Ellison and Wallace were rightly disqualified for showing incurved Japanese amongst them. Mrs. Stevenson quite gained notoriety by her admirable arrangement of basket and bouquet, still more bronze. Mr. A. Dodd was undoubtedly the lion of the evening; his cut flowers ranked very high, and were composed of *Eucharis*, *Orchids*, *Streptocarpus*, &c., first and certificate. So too with *Cattleya labiata* as the best single *Orchid*. There were many good plants for points, and taking the season the amateurs have made a bold and convincing set out.—R. P. R.

**Ipswich Mutual Improvement Society.**

The usual fortnightly meeting of the above society was held on November 20, Mr. R. C. Notcutt presiding. The subject for the evening was an impromptu discussion on Chrysanthemums, but from the small attendance of members one might infer that the popularity of the autumn flower was on the wane. Mr. Messenger, of Woolverstone Park Gardens, opened the discussion with a very able speech, indicating the principal points for debate. Most interest was aroused by this gentleman's remarks regarding the improvement of Chrysanthemum exhibitions, in which he advocated the total abolition of the show board and the substitution of vases. This view was generally supported by succeeding speakers, it being contended that a more artistic effect was obtained, also that the blooms were available for decorative purposes afterwards, while when shown on boards and denuded of all foliage they were practically useless for any other purpose. In discussing the question of exhibiting decorative varieties an interesting point was raised, viz., "What constitutes a spray?" It was suggested that the N.C.S. should provide a definition for the guide of its affiliated societies. Amongst those contributing to the discussion were Messrs. Chandler, Whittel, A. Creek, Close, E. Creek, Finley, and the chairman.—E. C.

**The Horticultural Club.**

The usual bi-monthly meeting of this club was held at the Hotel Windsor on Tuesday, the 18th inst., some thirty odd members and friends being present, and Mr. Harry J. Veitch taking the chair in the enforced absence of the president of the club, Sir John Llewelyn, Bart. Mr. Stevens, the well-known auctioneer, fulfilled his promise of giving a lantern exhibition of some of his remarkable photographs of flowers and animals, a promise which he more than fulfilled by adding thereto a considerable number of others, embracing landscapes and curios of many kinds, the exhibition of which, besides their unexpected variety and curious juxtaposition in many cases, being rendered additionally amusing by a fund of anecdote connected with his experiences thereanent as auctioneer. Groups of glorious *Orchids* gave place in dissolving view form to happy families of dogs, cats, and rabbits, to be followed by splendid specimens of poultry, huge cochins facing tiny bantams, black cats, white cats, furry Persian cats, and sleek cats, the biggest extremes being often brothers and sisters, great auks and their eggs, glimpses of lovely scenery, grim Maori heads, groups of Chinese officials, charming children, &c., followed each other

## Killerton, Devon.

Exeter is the county town of Devonshire, and Killerton, the residence of Sir T. D. Acland, Baronet, and Lady Acland, is a few miles from it. Exeter, the town, is beautifully situated on variedly undulating, or indeed hilly ground, being but a fac-simile of the surface contour through the whole southern districts of that sunny county, with sylvan brakes and virginal meads. The "City of the Waters"—Exanceastre—as the Saxons had named it, resisted the invasion of the Norman King William with unsurpassable intrepidity, and the siege of Exeter is one of the most romantic episodes in the history of the conquest of England.

One may be permitted a further digression to recall the names of some illustrious sons of Exeter, among whom are Sir Thomas Bodley, a sixteenth century worthy who established the magnificent Bodleian Museum at Oxford; Sir Vicary Gibbs (1750), the famous lawyer; William Gandy, the portrait painter; with Cardinal Langton, Sir William Petre, and others of lesser fame.

The region within a ten miles' circle of Exeter is numerously studded with townlets and villages, one of these being Broadclyst, named undoubtedly from the river Clyst, an important tributary of the Exe. Broadclyst is the post town for Killerton.

Famous for its trees, Killerton is a place of value in the eyes of "the man with a note book." Here one finds one of the earliest and largest of the Lucombe Oaks, growing outside the west garden wall. Many of the huge gnarled branches have grown together, and present strange forms. There are two forms of the Lucombe Oak, one having the unmistakeable Oak bark of the *Quercus Suber* and leaves of *Q. cerris*; the other form has the hard-ribbed bark of the common Oak. The tree at Killerton is assumed by some to have been worked on the common Oak, but it is difficult to detect the line of union of stock and scion, if such there be.

It was only in 1765 that William Lucombe raised this variety, and now the tree is of very massive proportions, and if it is proved to be as hardy and its wood as durable as that of *Quercus pedunculata*, there is every reason to hope that it may be very largely planted commercially. Mr. John Coutts, an Old Kewite, who has had charge of these gardens for two years, promises to send me the girth of this original Lucombe Oak.

Throughout the beautiful grounds surrounding Killerton House—which, unfortunately, lies low—there are interesting trees in abundance. The Evergreen Oaks are models of excellence, magnificent in form and size. Tulip Trees (*Liriodendron tulipifera*) are quite common, and one, at least, is said to contain more timber than any other of its kind in England.

Encompassing the private chapel in the grounds are double-lines forming avenues and circular rows of sentinel-like Cupressus—*C. erecta viridis* and *C. macrocarpa*. Each is a replica of its neighbour, and silently they hold themselves, as if the spirits of the air held an influence over them. Near at hand, but away from the chapel, stands a splendid *Abies Menziesi*, a model in evenness of

Twelve Japs., distinct, in trebles.

in bewildering succession, each one contributing a surprise, sometimes comical and sometimes weird. Mr. Golby, a visitor, lent some chromophotographic floral slides, made by himself, on the three-screen system, which were very beautiful. A hearty vote of thanks to both gentlemen was followed by a discussion in which Mr. Shea took part, and paid a well-merited tribute to the great ability displayed by Mr. Stevens, though he considered that colour photography on the screen system still left too much to individual peculiarities of treatment to be as yet capable of producing true colours. Mr. Golby, however, dissented, and considered that scientific handling rendered this possible.—C. T. D.

## EXHIBITS AT SOUTHAMPTON SHOW.

The illustrations of Chrysanthemums on these two pages are from photographs taken by Mr. E. Rye of Southampton at the exhibition held there on November 4, a report of which appeared on page 457 of our issue for November 13. The twelve Japanese varieties, distinct, shown in trebles, furnished a beautiful display. We illustrate the first prize collection, which was staged by Lady L. L. Ashburton (gardener, Mr. G. Hall), of Melchet Court, Romsey, and who obtained the Victorian Challenge Trophy for the ensuing twelve months, together with the society's medal. As may be seen from the reproduction, the Trophy vase is a work of art, and was, we are told, the object of much admiration during the time of the show. The twelve Japanese-incurved blooms shown at the base of this page won premier honours in class 7 for an amateur cultivator, Mr. C. Brown, jun., Alma Road, Southampton. The best varieties were Ethel Fitzroy, W. R. Church, Miss Alice Byron, and Princess Henry. [Mr. Brown is to be congratulated on the splendid specimens he exhibited and the remarkable success he attained. His entries numbered seven, and the awards were six firsts and one second. Mr. Brown won the two silver medals offered by the society for the most successful exhibitor in classes 11 to 15 and 16 to 19. Mr. Brown tells me he was only beaten in one class, and that was by the King, and he says he could not have been beaten by a worthier opponent. — E. E. RYE.]

The set of twelve Japanese Chrysanthemums on the opposite page were staged in class 3, from Mrs. Ogilvie (gardener, Mr. J. Davies), Rosecroft, Hambledon, winning first, and included Mrs. G. Mileham, Sir Herbert Kitchener, Pride of Madford, Madame Gustave Henri, Lord Salisbury, Edwin Molynaux, Madame P. Rivoire, Mrs. Coombes, Madame Hoste, Miss Alice Byron, Mutual Friend, and Phœbus.

Lastly, there are the six specimen Japs shown by His Majesty the King (gardener, Mr. G. Nobbs), Osborne House, Isle of Wight, in class 10, the varieties being Charles Davis and Australia—magnificent specimens. A general view of the fruit section will be given later.

Twelve Japanese-incurved Chrysanthemums.

contour. Groups of *Berberis Darwinii* are placed about, for this useful shrub is duly appreciated, and along the Devonshire coast, hedges are formed of it, the shears being but lightly used.

As one approaches Killerton House from the garden or chapel, wide and extensive views are obtained of the beautiful park with its herds of graceful deer and rugged ponies, the russet and crimson Beech woods rising up from the north side of the park to shelter the house and it. Besides the handsome patriarchal Beech, Oak, and Hawthorn trees adorning the expansive park, the incomparably rich hues of the Scarlet Oak (*Q. coccinea*) vividly glow beneath the streaming sunshine; and could there be a nearer semblance to "the earthly Paradise" than the picture thus feebly given—of the coolest of green grass stretching over many undulating acres and scarlet sun-illuminated foliage above, with sinewy deer in their innocence and elegance alone the inheritors?

*Kalmia latifolia* is usually seen as dwarf, tiny bushes, even in the latitude of London, but in the favoured south they obtain specimens 9ft high and 12ft through which enwreath themselves with flowers. *Berberis asiatica*, with pale spines, forms rounded bushes of interest, while *Fatsia* (*Aralia*) *Sieboldi* appears to good advantage and is of large size. Beds of Japanese Maples have lately been planted in place of the preponderance of Laurels and Rhododendrons previously on the spot. *Eucryphia pinnatifolia* is uncommon, and the same remark applies to *Olea ilicifolia*; tall *Cordylines* (*C. australis*) lend a sub-tropical character to the plantations.

Amongst Coniferous trees of note there is a *Libocedrus decurrens*, 70ft high; a *Thuyopsis dolabrata*, 36ft, one of three brought home from China by a Captain Fortesque, the others having gone, one to Frogmore, the other to Dropmore. It is a magnificent plant, with robust growth and a perfectly erect leader. A specimen *Fitzroya Patagonica* is 28ft high; a *Sequoia* (*Wellingtonia*) *gigantea*, 85ft; *Cryptomeria japonica*, 65ft; and a noble Douglas Fir, 70ft.

*Desfontainia spinosa* is a charming Holly-like shrub rarely seen northwards, though in parts of Ayrshire it flourishes. At Killerton in mid-November a large number of bushes were massed with the bright crimson tubular flowers, the mouths being tipped with orange. Mr. H. J. Elwes declares that at Killerton the plants luxuriate in a manner out of all comparison with the same species in its native Chilean habitats. At this place, too, there are three hoary Cork Oaks (*Q. Suber*) that, in the opinion of Mr. Elwes, "just look like the trees in their native home"

—northern Africa. These are 65ft high, and bear thick layers of cork. The Loquat (*Eriobotrya*—*Photinia*—*japonica*) grows sturdily on the open sunny banks, one plant being 9ft high and 12ft in diameter. Perhaps it may be fruited on a profitable scale, and the fruit is edible. The beautiful Snowdrop Tree (*Halesia tetraptera*) which, in the line of the Thames, or very little further northward, is always accorded the protection of a wall, at Killerton grows to 20ft. This is undoubtedly one of the loveliest of deciduous flowering trees.

To see *Embothrium coccineum* in the spring-time in parts of Devon and Cornwall is a sight of rare interest and splendour, but this very handsome shrub is only half-hardy. Groups of *Azalea indica* are becoming established out of doors in the gardens

Six specimen Japs.

here, and have remained almost unharmed through two or three winters. The only injured plants are those not shaded from the morning sun, for where the frosted plants have time to slowly thaw before the sun touches them they are well and healthy. *Eucalyptus coccifera*, with silvery-green foliage, furnishes a distinctively beautiful tree in the grounds. *Leucothoe* attains to bushy dimensions.

Another very effective tree during November, or earlier in a dry season, is the Liquidamber, with leaves of many richly tinted colours. The little Butcher's Broom (*Ruscus aculeatus*) grows wild wherever it is allowed to. A very curious shrub is *Colletia cruciata*, very dark green, and a mass of spiny growths. It is a subject of interest, though not of beauty, and would do well amid a collection of Brooms and *Ulex*, though it is one of the Rhamnaceæ. *Colletia spinosa* or *horrida* is coarser. Both have the same character as the Christ's-thorn (*Paliurus aculeatus* or *Spina-Christi*).

Rhododendrons are giants of their kind, and the best new varieties are being introduced. Mr. Coutts has already lifted some of the largest, like bushy trees, and replanted them in positions where their proportions will be more resplendently shown. One of these required three days to lift, transport, and replant it. Mr. Coutts is also raising batches of the choice Himalayan Rhododendrons

with the intention to plant them in well sheltered places about the kept grounds. Both Sir Thomas and Lady Acland are keen gardeners, and watch the present developments in their garden with much pleasure.

Amongst the new works engaging present attention, besides the remodelling or replanting of a large part of the grounds, there is an extensive rock-garden in process of making. The spot chosen lends itself remarkably well for the purpose, being on sloping, undulating ground, and not far from the house. Paths have already been laid down, and the general features of the rockery are planned. Boulders and stones are being fixed into position, and large pockets are a feature, for there is no necessity to confine the plantings. Rambler and trailing Roses, with species of *Rubus*, Honeysuckles, Clematis, and Vines, will be planted high up towards the back slopes of the rockery to heighten the effect and limit the vision. The same subjects are proposed for the upper ridges of a ferny ravine, which at present is an old sunk fence marking the boundary of the vast park. Lilliums, Mulleins, Foxgloves, and similar plants will accompany the Ferns in this part. Throughout large tracts of the sloping lawns amongst the

trees and shrubs there are thousands of Narcissi and other spring flowers. I must not omit to mention a quaint old summer house situated close by the new rock-garden, the floor of which is formed of the knuckle-bones of deer placed end upmost. Not far off from this spot there is a monumental marble column with plinth and lower base, erected to the memory of the present owner's grandfather by his county friends, Sir Thomas Acland, the grandfather, really made Killerton, and during his life and occupancy extensive plantations were made, as well as beautiful grass drives and roads throughout the estate. These are not now in the same keeping. The Deodar Glen, a magnificent sloping vista belted on either hand by huge Deodars, lies outside the garden grounds, but near the latter and the park. Seen at any time it

Twelve Japanese varieties.

is very beautiful, and must be quite a fairy scene when hoar frost or snow covers the branches of the trees.

In the fruit garden and amongst the glass houses progress has also to be recorded. New houses are being erected, and some of the old ones are being thoroughly renovated. Carnations are one of the chief features under glass, the gardener having freed the plants from disease by simply keeping them thoroughly dry at the root during winter. A healthier collection would be hard to find, both of *Mahmaisons* and *Trees*. *Begonia President Carnot* and *Clerodendron fallax* are nicely grown; *Cyclamens* are good as plants, though the strain is a poor one; *Bouvardias* are showy; *Tydaes* full of bloom; *Saintpaulia ionantha* in 3in pots on the edge of stages, sparkled with its "Violet" flowers; *Adiantum Farleyense* was perfect in every respect, and a fine batch was seen. Gold Ferns are largely grown and also a few Orchids, but these are of minor importance. A splendid plant of *Maréchal Niel* Rose in a lean-to house is treated in the manner recommended by Mr. W. R. Raillem, which is to cut down the shoots right to the base after they have yielded their quota of flowers in the spring, and to train up a new shoot in place of each one-year-old shoot removed. These straight cordon shoots are well ripened by the end of autumn, and are fit to, and generally do, produce basketloads of flowers early in the following year. But I must quit Killerton for the nonce.—J. H. D.

## Societies.

### Waterford, Co. Waterford, November 7th.

The annual Chrysanthemum Show, under the auspices of the Waterford Horticultural Society, took place on Friday afternoon in the Town Hall, Waterford, under very favourable auspices. The summer and winter shows of this society are regarded with the greatest interest not only in the city and county, but also in the neighbouring counties of Tipperary and Kilkenny. Under excellent management, and with the generous support accorded by horticulturists and fruit growers, it is pleasing to be able to record the fact that each succeeding exhibition marks an improvement. The chief classes included in the present show were Chrysanthemums—plants and cut blooms—fruit, vegetables, and roots. The entries totalled 251, as compared with 216 last year. In numbers a "record" was established, and as regards the quality of the exhibits all round the same remark might be made. The Chrysanthemum plants were most effectively staged in the Assembly Room, the cut blooms, fruit, &c., in the Council Chamber, and the vegetables and roots in the corridor and the small room leading off it. Everything was in perfect order when the judges commenced their work. To Mr. D. Cantwell, the efficient hon. secretary, is due principally the credit for the arrangements, which left nothing to be desired.

The following were the principal exhibitors:—Gardeners' classes: Lord Ashbrook, Durrow Castle (Mr. J. D. Atkinson, gardener); Lord Carew, Woodstown (Mr. Joshua Baker, land steward); W. G. D. Goff, Esq., Glenville (Mr. Hugh Innes, gardener); J. N. White, Esq., Rocklands (Mr. W. Taylor); E. A. White, Esq., St. Andrew's Terrace (Mr. Jas. Bagge); Mrs. Wall Morris, Ballinakill (Mr. Charles Walsh); W. Richardson, Esq., Prospect House (Mr. M. Hartley); R. Tyndall, Esq., Oaklands, New Ross (Mr. T. Dunne); Ursuline Convent, Waterford (Mr. John Farrell). Roots: P. Robertson, Esq., Annfield, Piltown, and A. G. Bowers, Esq., Silverspring, Piltown. Amateur classes: Mrs. Ridgway, River View; Mrs. P. Moloney, Newtown; Mrs. Snow, Blenheim House; Messrs. W. E. Bowers, Ballinvoher; D. Cantwell, Terminus House; James Moloney, Doneraile Terrace, Tramore; E. D. Trundle, Ballyin, Lismore; P. Hand, Newtown, and F. Lanigan, Grange.

The judges of the flowers and vegetables were Mr. David Crumbie, gardener to the Marquis of Waterford, Curraghmore, and Mr. John McClelland, gardener to Lord Carew, Castle Boro, Enniscorthy. For field crops: Mr. John Glennie, land steward to the Marquis of Waterford, and Mr. Wm. Mitchel, steward to Viscount Duncannon.

The cut blooms were a really splendid collection, and it would be impossible to get a finer assortment of plants. The Glenville gardens secured the Goff Challenge Cup and three first prizes for plants, and in the classes for cut blooms a silver medal (presented by Mr. J. N. White), a first, two seconds, and a third prize. They were undoubtedly the finest exhibit at the show, and reflected the greatest credit on Mr. Hugh Innes, the gardener at Glenville. Lord Ashbrook secured the Nelson and Mosley Challenge Cups and a number of other prizes.

The silver and bronze medals offered by Messrs. Wells and Co., of Redhill, Surrey, for novelties, were awarded to Mr. J. N. White and Mrs. Wall Morris, who were also prizewinners in other classes. The exhibits from the Ursuline Convent, Waterford, were very handsome, and were awarded several prizes. In the amateur classes Mrs. Moloney, Mr. D. Cantwell, and Mr. W. E. Bowers shared the principal prizes. Mr. W. Richardson secured three first prizes in the classes for Zonals, Primulas, and

Cyclamens. A section for Violets was introduced for the first time this year, and there were some very fine exhibits. The Glenville gardens secured two first prizes, and Mr. W. Richardson two seconds. Mr. W. E. Bowers showed some cut blooms of the *Princess of Wales* variety. They were not in competition, but the judges gave them a highly commended award. Mr. Bowers was very successful in the fruit classes, and Mrs. Snow, Mrs. Ridgway, and Mr. Tyndall were also among the chief prize-winners in this section. The attendance during the afternoon was numerous and fashionable, and in the evening it assumed very large proportions. The Waterford Amateur Brass Band was present and played a choice selection of music.

### York Chrysanthemum, Nov. 12th, 13th, and 14th.

The annual Chrysanthemum Show of the Ancient Society of York Florists was held in the Exhibition Buildings on the dates given. While nominally a Chrysanthemum show, the exhibition, as is well known, comprises many other features, including fruits and vegetables, and several classes for miscellaneous flowers. The total entries, which numbered 725, are about the same as in other years, being made up as follows:—Groups, 16; tables, 6; plants, 81; cut flowers, 174; fruit, 124; vegetables, 301. Special attractions were provided in the afternoon and evening in the shape of selections by the band of the Duke of Wellington's Regiment.

Class 1 was for a group of Chrysanthemums in a space of 100 sq. ft., for prizes of a piece of plate, value ten guineas, given by George Denison Faber, Esq., M.P., and eight guineas added by the society; second prize, seven guineas; and a third of five guineas. The awards fell to Mrs. Whitaker, E. B. Faber, Esq., and G. Cottam, Esq., respectively. In class 2, for a similar group, 80 sq. ft., the recipients were J. W. Hields; second, H. B. Oldham; third, E. B. Faber; and fourth, Mrs. Whitaker, the awards being given for cultural excellence only. The succeeding class was for a pillar group with a mirror in the centre, the first prize of a piece of plate being given by the Lord Mayor (Alderman L. Foster, J.P.), with monetary prize by the society. The honour of the first prize went to Messrs. R. Simpson and Son. A mass of foliage and flowering plants, with light Palms and an Orchid or two at the top, was built up on a foundation of cork bark lashed to the pillar, and the judges evidently favoured the freeness of arrangement seen in the winning group. Amongst the items used were *Salvias*, *Spiræas*, *Dracænas*, Palms, and Chrysanthemums; whilst the *Cissus discolor* trailed gracefully over the top of the mirror. The second group, shown by Mr. J. Key, consisted of a free arrangement of Chrysanthemums, Lilies, and Pelargoniums, with trailing plants, chiefly *Asparagus plumosus*, and the result was worthy of the praise bestowed upon it. Mr. Cottam was third.

A large number of special prizes were presented, notably by Messrs. Clibran and Son, of Aittrincham; Mr. H. J. Jones, Ryecroft, Lewisham; Anglo-Continental Guano Company; and Wells and Co., Limited, Earlswood, Surrey. In the cut flowers (open) division some splendid flowers were on view. For the thirty-six, eighteen each of incurveds and Japs, Mr. A. Tate led off, followed by Messrs. Baird and the Earl of Harrington. Mr. Tate was again the leader for the incurved eighteen; while for twelve, ditto, Lady Walker was foremost. The winners for eighteen Japs, distinct, were Mr. A. Tate first; with the Earl of Lonsborough second; the Hon. T. Dundas third; and the Marquis of Ripon fourth. For the dozen, Lady Walker led; and second, the Marquis of Ripon.

The show of fruit was better than could reasonably have been anticipated, in view of the bad season. As usual, there was a keen competition amongst the exhibitors in the Grape section, and the judges must have found it difficult to discriminate between at least four or five of the lots submitted to them. In the class for six bunches of Grapes, three varieties, Lady Walker secured the premier honour with some well-finished bunches full of very fine berries. One bunch of Muscats appeared to be slightly under-coloured. In the class for two bunches of black Grapes, Lady Walker also won the first prize with some beautiful Black Alicante. The class for collections of dessert fruit, each to have six distinct varieties, attracted a good number of exhibitors. Lord Lonsborough was placed first with a collection remarkable for the fine clear colour of the fruit. The Grapes shown by the second winner, Mr. McDoe, were hardly so well coloured.

Quite a new departure has been made this year in the fruit section, six classes of which are reserved exclusively for the produce of Yorkshire gardens, grown in the open air. The response on the part of exhibitors has been most gratifying, and the quality of the fruit indicates that in spite of climatic drawbacks, peculiarly its own, Yorkshire-grown fruit can compare favourably with that even from the fruit orchards of the sunnier South and Midlands. There was an excellent display of vegetables, which, as usual, occupied the whole of the north galleries.

There was a very good attendance at the show in the afternoon and evening, when the band of the Duke of Wellington's Regiment played a popular selection of music. The admirable arrangements for the show were carried out by an efficient committee, with Mr. George F. W. Oman as secretary.

It was the general opinion that the attendance for a first night was the greatest ever known. This was probably correct, although the receipts were not as great as has been the case once or twice. But it must be considered that there are now considerably over 700 members who have a couple of complimentary tickets at their disposal, and the membership was not so great in the past. Therefore, although the paying admissions may not have been so great (more than 1,000 had 1s. tickets), the crowd was probably the biggest. On the first day the receipts were £126 7s. 10d.; in 1901, £85 16s.; in 1900, £128 16s. 11d.; and in 1899, £141 2s. 2d.

Amongst the trade exhibits was a wonderful Orchid, *Odontoglossum grandis*, with forty-eight blooms, shown by Mr. E. Hall, of Leyburn. Messrs. Walshaw and Son, Scarborough, had a notable collection of Lilies of the Valley, Trumpet Lilies, flowering Heaths, Begonias, and *Solanum capsicastrum*. Messrs. Mack and Miln, Darlington, were awarded the gold medal for the best trade exhibit. Their stall, which was situated at the entrance of the large hall, was decorated with some fine specimens of Roses grown at their Catterick Nurseries. The centre is occupied by a fine *Acalypha*, and around it is a group of beautiful Begonias of the Lorraine type, bordered with Gloxinias. These in their turn are flanked by a fine show of Cyclamen in white, rose, and crimson, arranged with Maidenhair Fern. Beautiful specimens of the scarlet *Amaryllis* completed the display, which was very effective. Messrs. House and Son showed some charming Violets; and choice specimen Chrysanthemums were, as usual, to be found on Messrs. W. Wells and Company's stall.

### Frome, November 13th.

The annual show in this thrifty little borough was held under the most favourable of autumn weather, the show, a record one in point of entries, surpassed even itself in its excellence of all-round quality. The principal class, that for twenty-four Japanese, distinct varieties, brought out a spirited entry, no less than six excellent stands being staged, Mr. Robertson, gardener to J. S. Donne, Esq., Castle Cary, securing first prize with, as his best blooms: Nellie Perkins, Lord Ludlow, Mrs. G. Milcham, M. L. Remy, Ella Curtis, and a fine bloom of the old Julia Scaramanga. Mr. Strugnell, gardener to Colonel Vivian, Rood Ashton, was second; and the Frome Fruit and Flower Co. third. In the next class, for twelve varieties, Mr. Pope, gardener to Chas. Baily, Esq., won from Messrs. Robertson and Cray and Sons, Mrs. J. Bryant, Vicar of Leatherhead, Mrs. Mease, and Matthew Smith being very fine. Twelve incurved Japanese found but one competitor, but six of one kind brought up some of the finest blooms in the show. Mr. Pope staged Mrs. Mease for this, and for a single bloom for first prizes. There are also district classes for cut blooms, which are well contested.

Groups are always a fine feature at the Frome shows, and the rivalry very keen among local men. In the nurserymen's section Messrs. Cray and Sons beat the Flower and Fruit Co., though each production was fitted for a greater contest; and in the gardeners' class, Messrs. Pope and Moore, gardener to Miss Sinkins, Frome, excelled. There are classes for specimen untrained Chrysanthemums, Ferns, foliage plants, all of which display skill in growth and artistic arrangement. Begonias form a new class, and a bright one, too, the best six coming from Mr. Pope. Cyclamens and Primulas were staged in good form by Mr. Strugnell, and table plants by Mr. Runnacles, Sherborne. Vases of Chrysanthemums, decorated tables, baskets of autumn foliage, bouquets, &c., all find encouragement, and a new class for Violets arranged in vases found many admirers. Mr. Strugnell staged these in six varieties, Mr. Pope being second.

The non-competitive groups from Mr. Pearce, gardener to the Earl of Cork, and Mr. Gandy, gardener to the Marquis of Bath, are features of great value, that from Marston in particular, by reason of the grandly coloured Crotons, Dracenas, Begonias, and other plants, which fill the end of the spacious market hall.

The shortness of the fruit crop accounted for a lesser strain on space, though quality was none the less present. Two good collections were staged in the class for six dishes, Mr. Strugnell and the Frome Fruit and Flower Co. being the winners; the first named also won with three dishes of dessert and three of cooking Apples; also Pears. The Fruit and Flower Co. won with black Grapes; and Mr. Morse, gardener to Mrs. Knatchbull, white. Vegetables are uncommonly good at Frome shows, and this season especially so, though the competitors are not drawn from beyond a local area. Mr. Vincent is most assiduous, painstaking, and popular as a secretary, and well deserves the high praise bestowed upon him by everyone—competitor and patron alike.

### Barnsley, November 13th and 14th.

The sixteenth annual exhibition of the Barnsley Chrysanthemum Society took place in the Public Hall, Barnsley, and was an unqualified success. The exhibits throughout were excellent, considering the wretched season, while there was only a slight fall in the entries in the local classes. Fruit throughout was good, particularly in the Grape sections, and though there was

not an extensive display in groups, the winning collection was one of the finest ever exhibited in Barnsley. It was a splendid arrangement, intermixed with handsome foliage plants. The four corners were composed of *Cattleya Prince of Wales* and *superba* and the effect was most brilliant, and one of the prettiest we have seen in the north of England tour. The prizewinning blooms, both in the incurved and Japanese classes were the property of Mr. A. Alderman, gardener to G. D. Ellis, Esq., Sparken House, Worksop, who always brings his best to this show, and invariably is well rewarded. The bouquets were a special feature of the show, and a decided improvement upon last year's exhibits. The awards, which were distributed by Mr. W. Daniels, of Dewsbury, and Mr. J. P. Leadbeater, of Tranby Croft, were adjudged as follows:—

**OPEN CLASSES: PLANTS.**—Group of Chrysanthemums, flowering and ornamental foliage plants, arranged for effect, occupying 64ft: First, A. E. Wilson, gardener to Mrs. Guy, sen., Beever Hall, Barnsley; second, J. Nall, Esq., Aldersgate House, Barnsley (gardener, Mr. F. Buck).

**CUT FLOWERS.**—Eighteen incurved, not less than twelve varieties and not more than two of one variety: First, A. Alderman (gardener to J. D. Ellis, Esq., Sparken House, Worksop); second, A. Brooks (gardener to the Countess of Rosse, Womersley Park, Pontefract); third, J. Findley (gardener to Mrs. R. H. Heywood-Jones, Badsworth Hall). Eighteen Japanese, not less than twelve varieties and not more than two of one variety: First, A. Alderman; second, A. Brooks; third, J. Findley. Twelve incurved, not less than eight varieties and not more than two of one variety: First, A. Brooks. Twelve Japanese, distinct: First, A. Brooks; second, J. Findley. Six incurved, any variety: First, A. Brooks; second, W. Michael (gardener to A. P. Woodruff, Esq.), Hall Bank, Barnsley. Six Japanese, any variety: First, A. Alderman.

**Bouquet made of Chrysanthemums and any kind of foliage:** First, A. Alderman; second, G. Wilkinson, Barnsley; third, T. Ketchell (gardener to C. H. Simpson, Esq., Moor Top House, Ackworth). **Vase of Chrysanthemums, any variety, with Chrysanthemum foliage, arranged for effect:** First, T. Ketchell; second, A. Gibson (gardener to R. K. Micklethwait, Esq., of Ardesley House, Barnsley); third, A. Lockwood, Barnsley. **Six vases of Chrysanthemums, single flowering, not less than four varieties and not more than two vases of one variety, six sprays of one variety in each vase:** Third, E. Foster. **Six vases of Chrysanthemums, six varieties, three of one variety in each vase:** First, A. Gibson (gardener to R. K. Micklethwait, Esq., Ardesley House, Barnsley); second, A. Brooks; third, A. Alderman.

**FRUIT.**—Collection of dessert fruit, consisting of one bunch black Grapes, one bunch white Grapes, two varieties Apples, six of each, two varieties of Pears, six each: First, J. Findley; second, A. Alderman; third, T. Ketchell. **One bunch of black and one bunch of white Grapes:** First, J. Findley; second, A. Alderman; third, T. Ketchell. **Dish of six dessert Apples:** First, A. Brooks; second, W. Winter (gardener to C. Fox, Esq., Cockerham House, Barnsley); third, A. Alderman. **Dish of six cooking Apples:** First, A. Brooks; second, A. Alderman; third, F. Buck. **Dish of dessert Pears:** First, J. Findley; second, W. Winter; third, A. Brooks.

**PRIMULAS.**—Six Primulas in pots, white or coloured, single or double: First, A. Alderman; second, A. Gibson; third, A. E. Wilson.

**DECORATIVE PLANTS OR FERNS.**—Six dinner-table plants or Ferns, distinct, in pots not exceeding 6in in diameter: First, A. Gibson; second, W. Winter; third, E. Foster. **Two Palms, dissimilar:** First, A. Gibson; second, A. E. Wilson. **Three ornamental foliage plants, Palms excluded:** First, A. Gibson; second, E. Foster.

Too much praise cannot be awarded to Mr. W. B. Armitage, the popular secretary (who, we are pleased to hear, has now recovered from his serious illness), and a very popular attraction which made the show a financial and social success was the concert performances of the Queen's Own Yorkshire Dragoons' Band.

### Chester Paxton, November 13th and 14th.

The fourteenth annual exhibition of the above society was held in the Assembly Room of the Town Hall, Chester. The show was found in all departments well up to its former standards of excellence, and great credit is due to the active members of the society for the tireless energy with which they carry out the arduous organisation the exhibition entails year after year.

To encourage cultivation of the single varieties, Captain McGillyeuddy, Bache Hall, offered for competition a handsome silver Challenge Cup, together with £5 in prizes, and by a happy coincidence the trophy was carried off by the donor's own gardener, Mr. E. Stubbs. The second prize went to Mrs. Townshend Ince, Christleton Hall (gardener, Mr. Thomas Weaver).

In the large bloom class, in which the entries numbered only three this year, the premier honours fell to Mr. T. Gibbons Frost (gardener, Mr. Gilbert), who staged one of the most magnificent collections ever seen at a Paxton Society's show. Dr. Lawrence, County Asylum (gardener, Mr. Ellis), secured second prize with

a very creditable group; third, Mr. E. Dixon, Littleton Hall (Mr. J. Dutton, gardener).

A new class for eighteen cut blooms produced a magnificent display, and first prize was easily carried off by Sir George Meyrick, Bart., Anglesey (gardener, Mr. W. Pilgrim), while the second went to a new exhibitor in the person of Mr. W. E. Whinneray, Leighton Court, Neston (Mr. Thos. Jennion, gardener). The single varieties of cut blooms were largely represented, first prize going to Mr. J. Mossford, Tattenhall (gardener, Mr. J. Breen). There were also strong entries in the class for naturally grown trusses, and first and second prizes were won respectively by Mrs. Townshend Ince and Mr. C. Threlfall, Tarporley. In the class for nine Japanese blooms the Hon. Mrs. Kenyon, Macfen, took first prize with a magnificent group of blooms of various shades of colour.

As usual, Messrs. Dickson's honorary exhibit occupied the lower end of the room, and was quite unique in its way. There were exceptionally attractive floral designs of a harp and an anchor, with a bridal bouquet.

Messrs. McHattie and Co. staged an interesting exhibit of Apples, Pears, Tomatoes, and foliage and flower plants, and Mr. F. W. Dutton, Queen's Park Nurseries, staged a pretty exhibit, which included a cross, anchor, a bridal bouquet, Lilies of the Valley, sweet-scented Violets, &c.

A unique display of Apples, Bananas, Oranges, and Grapes was staged by Messrs. J. Little and Son, Eastgate Row, who kindly obtained the collection from Sir A. L. Jones, of Liverpool. Sir A. L. Jones, as is well known, takes a great interest in the importation of colonial fruit, and this exhibit, which was composed entirely of colonial fruit, was examined with much curiosity. A magnificent display of fruit and flowers was sent by Mr. Barnes, head gardener to the Duke of Westminster. It included Apples, Pears, and Grapes, with a striking variety of cut flowers, the whole effect being of a most pleasing character (gold medal). Mr. John Taylor sent fine specimens of Arbutus in flower and fruit, which had been grown in the open at Colwyn Bay. This shrub will not bear fruit or flower in Cheshire. The judges were as follows: Chrysanthemums, Grapes, and table decorations, Mr. Doe, head gardener to the Earl of Derby, Knowsley Park, and Mr. Flack, head gardener to the Marquis of Cholmondeley; gardeners' section for fruit, Mr. Severn, gardener to Katherine Duchess of Westminster, Combermere Abbey, and Mr. John Taylor, late of Hoole Hall, and now of Colwyn Bay; remaining sections for fruit, the Rev. L. Garnett and Mr. Ford, gardener to B. Glegg, Esq., Backford. The arrangements were admirably carried out by the executive committee, with the able assistance of the enthusiastic hon. secretary, Mr. G. P. Miln.

### Edinburgh, November 13th, 14th, and 15th.

(Concluded from page 483.)

**MISCELLANEOUS PLANTS.**—These made a good show, and though not the best time of year for tender subjects, the competition was keen. For the best group of Chrysanthemums and other flowering and foliage plants there were this season only two entrants—the veteran, Mr. Wood, Oswald House, and Mr. Hunt, Murrayfield, also an old competitor. They were placed in the order named, Mr. Wood excelling his rival in quality of bloom and massiveness, but Mr. Hunt struck quite a new line in Chrysanthemum group arrangement, and for effect far out-distanced his rival. This consisted of a good centre group, with smaller groups at the corners, with dotted plants at intervals between. It was much admired by visitors, and should set a pattern for more graceful arrangements in future. For Palms Mr. G. Wood and Mr. McMillan, Trinity, divided the honours. Mr. Lunt and Mr. McIntyre, The Glen, were respectively first and second for Dracenas. For decorative foliage plants Mr. A. Knight, Lenzie, was first with capital plants, and Mr. McMillan, Douglas Castle, second. There were also good displays of Primula obconica and Chinese Primulas, zonal Pelargoniums, Roman Hyacinths, table plants, Ferns, &c. A class for Begonia Gloire de Lorraine was specially noteworthy, the six plants from Mr. Young, Hartrigge, which gained first prize, being specially well grown and attractive.

**FRUIT.**—For the late period of the season fruit made a fine show. In the Grape classes there were no fewer than fifty entries, mostly of excellent quality. For four bunches distinct varieties Mr. Leslie, Pitcullen House, Perth, was first with fine bunches, and Mr. Kidd, Carberry, second. For two bunches, one black and one white, Mr. Kirk, Alloa, was first, and Mr. Leslie second. For two bunches Muscat of Alexandria Mr. Kirk was first with grand bunches of splendid golden colour, said to be the finest coloured Muscats seen this season. Mr. Kidd was second with a pair of bunches that would have been fine, if Mr. Kirk's had been absent. For Gros Colman Mr. Leslie was first, and Mr. Kidd carried first for Lady Downe's. For collection of eight kinds of fruit Mr. Kidd secured first honours with good dishes, his Grapes carrying him well through. Mr. Kidd, as a comparatively young man, has made a marvellous stride in fruit competition this season, and promises soon to take front

rank. Mr. McIntyre was a good second for collection. There was a good display of Apples, which were well coloured and good size for the season. Mr. Moir, Rosehampton, secured first for eighteen varieties grown in Scotland with fine examples, Mr. Lawrie, Prestwick, being a good second. For eighteen varieties (open) Mr. Martin, Corndean, was well first. Other fruits were equally good and well contested.

**VEGETABLES.**—These were very largely in evidence, and were quite an exhibition of themselves, the entries being over 300, and quality was mostly above the average. For the collection of ten varieties three noted growers stood in order of merit as named: Mr. Waldie, Dollar; Mr. Harper, Tullibelton; and Mr. Rae, Kelso. These were very fine and equal to any show. For six kinds Mr. Waldie was again first, and Mr. Dickson, Glenormiston, second. For separate dishes of vegetables there was a very keen competition, in some classes the entries being over thirty (thirty-eight for red Beet). Quality was mostly good, especially Leeks, of which there were some grand specimens, the first prize ones, from Mr. Hood, St. Boswell's, being marvels of high cultivation.

**NON-COMPETITIVE EXHIBITS.**—These were not quite so numerous as usual, but for the most part were both meritorious and attractive. The most notable was that put up by Mr. Godfrey, of Exmouth, who travelled north for the first time to show the canny Scot his prowess as a raiser and grower of Mums and other specialities. He filled a sloping table, 4ft long, with a most attractive display of Chrysanthemums, largely of his own raising, conspicuous among them being Mrs. D. O. West, Glory of Devon, F. E. W. Dawes, Col. Weatheral, F. S. Vallis, Mafeking Hero, &c. The table was beautifully relieved with Crotons, Asparagus, and other foliage. Mr. Godfrey also made a nice display of Carnations and zonal Pelargonium blooms. We are sure the attention given to Mr. Godfrey's exhibit would be highly gratifying to him, and it is to be hoped he may become an "annual" at Edinburgh. A gold medal was deservedly awarded.

Messrs. Thomson and Sons, Clovenfords, staged a nice exhibit of Palms and other foliaged plants, along with a number of baskets of splendidly grown Gros Colman Grapes (silver medal).

Mr. John Downie, Edinburgh, exhibited a large group of Coniferae and ornamental shrubs, arranged most artistically on the floor. These were beautifully varied as to colour, the golden tints of the Maples being specially effective to relieve the more sombre greens (silver medal).

Messrs. Dickson and Sons had a smaller collection of shrubs and Conifers, which was attractive. Messrs. Dicksons and Co. exhibited a table attractively filled with Primula obconica in very varied shades, and other flowering and foliage plants (bronze medal).

Messrs. W. Wells and Co., Red Hill, Surrey, brought a nice exhibit of new Chrysanthemums and a fine collection of single-bloomed varieties: Mrs. T. Longley, Mary Inglis, S. T. Wright (very bright), Pantia Ralli, were most conspicuous. Messrs. Wells were awarded a prize for new Chrysanthemum not in commerce, Mary Duckham.

Messrs. Laird and Sons exhibited a "strange device" in Dahlias in the shape of a cottage fireside, with chair, &c. As a Dahlia exhibit in November it was wonderful, and the quaint way they were exhibited attracted much attention (silver medal).

Messrs. Dobbie and Co., Rothesay, exhibited a highly attractive exhibit of fifty varieties of Potatoes, new and old. These were fine samples and most effectively staged (silver medal). Messrs. Boyes and Co., Leicester, exhibited a small but most attractive table of cut Carnations, of which they make a special feature. A special certificate of merit was awarded.

Messrs. House and Son, Westbury, Bristol, had a very pretty table of the choicest varieties of sweet Violets. Mr. Thos. Scarlett, Edinburgh, exhibited a table of novelties in Potatoes, including Northern Star, a new variety in such repute that 10s. per pound is asked for seed. As usual at this exhibition the Ichthemic Guano Company, Ipswich, had a pretty stand, very elegantly decorated with Chrysanthemums in pots, Palms, Ferns, &c.

One of the leading features of the show was a floral exhibit by Messrs. Todd and Co., the well known Edinburgh floral decorators. On a semicircular table, about 20ft in length and 10ft broad at the centre, they exhibited in a most effective and elegant manner a large number of beautifully executed wedding designs—brides' and bridesmaids' bouquets of great richness and elegance, and of artistic combinations. One of various Cypripediums and green foliage, with ribbons of Royal blue, was greatly admired. Orchids, Lily of the Valley, Carnations, and choice Roses were used in great profusion. A large harp of golden Chrysanthemums foreground, lavishly decorated with Cattleya blooms, and festooned with russety Beech leaves, was marvellously effective. A muff of fairy flowers, sprayed with pink Carnations and Asparagus, was much admired. A silver wedding basket, with double heart, with dates painted on silk, was a source of great attraction. Two beautiful hearts, with doves and initials in Violets, were most effective. A horn of

plenty, in *Parmas* and *Lily*, and a fairy slipper in the same combination were noticeable among other appropriate devices. The whole was surmounted by a beautiful floral wedding bell—white, decorated with *Safrano* Roses. This was suspended from the roof of the building, and had an electric lamp as a tongue. This exhibit was the popular draw of the exhibition, and from the general visitors received great commendation. This exhibit was awarded the £20 prize as the most meritorious trade floral exhibit.

The exhibition was highly successful in a monetary point of view, the weather being ideal for November, while the splendid music of the Grenadier Guards' band drew crowds of visitors. The total drawings were £958 10s., exclusive of tickets sold outside, and the number of visitors during the three days were only a few short of 40,000.

### Sheffield, November 14th.

The annual show was held in the Cutlers' Hall, and in point of entries and quality of exhibits exceeded previous years, the first twenty-four incurveds in the open class being acknowledged as the finest board staged for years. The groups, although only two entries for the district class, showed a decided improvement, both in taste and quality of flowers. The groups for cottagers, of which there were five, were also superior to previous years. Table decoration, a feature only introduced last year, has seven competitors, and the evenness of the taste made judging somewhat difficult. Fruit and vegetables, the latter only inserted in the schedule this year, were very meritorious.

There were five exhibitors for twenty-four incurved blooms, not less than eighteen distinct varieties, the first prize going to Mr. Higgs, gardener to J. B. Hankey, Esq., Feteham. The back row flowers were: Frank Hammond, Mrs. F. Judson, Countess of Warwick, Madame Ferlat, Ialene, Chrysanthemiste Bruant, Duchess of Fife, and Salem; the second row: Ralph Hutton, Major Bonaffon, Egyptian, Topaze Oriental, Countess of Warwick, Comtesse d'Etoile, Ralph Hutton, and Mrs. H. J. Hutton; third row: Chas. Curtis, John Doughty, Duchess of Fife, G. Loek, Mrs. F. Judson, C. B. Whitnell, J. Agate, and C. Curtis. The second prize fell to Mr. C. Crooks, gardener to the Dowager Lady Hindlip, the back row flowers being very fine, and contained excellent samples of C. Curtis, Duchess of Fife (two), H. J. Jones, Nellie Stevens, Miss Nellie Threlfall, Nellie Southam, and Lady Isabel. The other rows were neat, fresh flowers, but smaller. The third prize was awarded to Mr. C. W. Findlow; fourth, Mr. C. Scott. In the class for twelve incurveds only two competed, the first going to Mr. Crooks, second Mr. F. J. Clark.

In the class for twenty-four Japanese, not less than eighteen distinct varieties, there were seven competitors, and very keen competition resulted. Mr. F. S. Vallis obtained first. His back row consisted of: Madame Carnot, Edwin Molyneux, Mrs. Mease, T. Carrington, Mrs. J. Lewis, Le Grand Dragon, Australie, Madame Carnot; second row: M. Louis Remy, Madame Paolo Radaelli (a very fine flower), Mrs. J. Bryant, F. S. Vallis, W. R. Church, Calvat's '99, Mrs. Greenfield, and Mons. Chenon de Leché; third row: Geo. Mileham, W. R. Church, Mrs. J. Lewis, Mrs. Barkley, Mrs. Mease, Edwin Molyneux, Madame Herrewé, and again Mrs. Barkley. The second prize went to Mr. Higgs, who staged good examples of Madame Carnot, Mrs. H. Weeks, Madame G. Debic, Florence Molyneux, Madame Herrewé, and J. T. Thorneycroft. Third, Mr. Alderman; fourth, Mr. F. J. Clark. In twelve Japs there was only one competitor, Mr. F. S. Vallis. In six Japs there was more competition, but Mr. Vallis again obtained first; second, Mr. Clark; and third, Mr. Crooks. In the class for affiliated societies, twenty-four blooms, twelve Japanese and twelve incurved, not less than eighteen distinct varieties, the first went to the Chesterfield Chrysanthemum Society, the second and third to local societies. There were five exhibitors.

Messrs. Peed, of London, showed fruit of most excellent quality, not for competition, whilst Mr. H. J. Jones and Mr. Wells also staged examples of new and older varieties of exhibition blooms. Groups not for competition were also shown by Mr. Hiram Shaw, nurseryman, and Mr. S. W. Seagreave, nurseryman, both of whom obtained a gold medal, as also did Mr. J. Artindale for floral decoration.

The cottagers' class, which is a great feature of the Sheffield Society, showed great competition, forty-seven boards of six blooms and an equal number of three blooms being staged. Seventeen cottagers also competed for the vase of Chrysanthemums with foliage, and generally the exhibits of cottagers showed a vast improvement on previous years.

### Bradford Chrysanthemum, November 14th and 15th.

The sixteenth annual exhibition promoted by the Bradford and District Chrysanthemum Society was held in St. George's Hall, Bradford. In the open classes the competitors were not only numerous, but some of the blooms which they sent in were by common consent the finest specimens of Chrysanthemums which have ever been seen at the Bradford Chrysanthemum Show.

The three exhibits arranged in competition for prizes offered

for a group of miscellaneous plants constituted a charming feature of the exhibition. The first prize in this class deservedly fell to Mr. William Taylor, gardener to Mr. George C. Waud, of Ferniehurst, Baildon, for a group most lightly and tastefully arranged, which contained some fine Orchids, including *Cattleya labiata*, *Oncidium varicosum* Rogersi, and a fine variety of *Odontoglossum*.

The principal prize in the show, a sum of £10 and the society's Challenge Cup, offered for a collection of twenty-four Japanese blooms, was won by Mr. A. Chandler, gardener to Mr. Arthur James, of Rugby, with a series of wonderfully fine blooms, including specimens of the well-known varieties: Ethel Fitzroy, Mrs. G. Mileham, M. Louis Remy, Lord Ludlow, M. Chenon de Leché, W. R. Church, Lady Hanham, Duchess of Sutherland, Le Grand Dragon, Madame R. Cadbury, Mrs. H. Weeks, Mrs. Barkley, Mafeking Hero, Mrs. J. Bryant, Sensation, Australie, Vicar of Leatherhead, and Calvat's '99. The second prize went to Mr. E. Ellis, of Heswall, Cheshire, for a collection which, though exceptionally strong, was quite justly placed second to Mr. Chandler's exhibit. The collection included the following varieties:—Mrs. Barkley, Marquis V. Venosta, Lord Ludlow, Madame G. Henry, and Miss A. Byron.

In the class for incurved blooms the first prize went to Mr. Charles Ritchings, gardener to Miss Baird, of Malvern, for a collection which contained uniformly large, close, and finely built blooms, including the following varieties: Fred Palmer, Lord Alcester, Miss A. Hills, R. G. Kingston, Golden Madame Ferlat, C. H. Curtis, White Empress, Violet Tomlin, Topaze Orientale, Hanwell Glory, Pearl Palace, Thomas Singleton, Nellie Threlfall, Mr. E. Bennell, L. Giles, and Chrysanthemiste Bruant, placed second and third respectively with excellent exhibits; and all three exhibitors were successful in the classes for smaller collections of blooms.

The local classes were less satisfactory. Lord Masham's cup, which had been won twice by Mr. John Thornton, of Drighlington, was wrested from that exhibitor by Messrs. Clark and Son, of Rodley. Mr. Mark Pemberton, of Milner Field, who took the first prize for twelve Japanese blooms, showed some blooms of excellent quality, and Mr. T. Wood, gardener to E. R. Firth, Esq., of Saltaire, also included in the collections, which secured two first prizes, some very fine blooms. Mr. J. W. Hatton, of Heaton, and Mr. J. Collinson, gardener to Major Mitchell, of Manningham, were the principal contributors.

The National Society's Certificate of Merit was awarded to Mr. Chandler, winner of the challenge cup, for the premier bloom in the exhibition. The winning flower was Ethel Fitzroy, a Japanese variety, orange amber in colour, of enormous size, and fully 6in in depth. Certificates were also awarded to Mr. Rudolf Eichel, Orchid grower, Gilstead, for a fine display of Orchids and other choice flowering plants, sent not for competition, and also to Mr. H. Dickinson, of Shardlow, Derbyshire, for a fine collection of Grapes. In the bouquets and cut flowers much artistic skill was displayed, the work of Mr. John Brooke, of Bradford, being deserving of special mention. The judges were Messrs. Moore, Wilson, Daniels, and Leadbetter. The exhibition was opened yesterday by the Mayor of Bradford (Alderman David Wade), Alderman Wright (chairman of the Parks and Cemeteries Committee) presiding. Mr. H. Spencer, of Horton, Bradford, as honorary secretary, deserves all thanks for his courtesy and energetic attentions to all around him.

### Swindon, November 14th and 15th.

That flowers have no charm for the thousands of G.W.R. employes was eloquently proved by their absence from such a bright, varied, and most excellent exhibition as that which the Swindon Society provided on the above dates. We can scarcely recall an instance where patronage was so grudgingly accorded, and yet, while the exhibition was still open, apparently thousands were traversing the streets with no definite object in view. Reverses are common, success scarcely known, and yet the society continue to persevere, with the hope of educating the populace towards a better appreciation of things floricultural. We hope they may yet succeed. Chrysanthemums necessarily comprise the chief classes as cut flowers and groups of plants.

A good class was made in that for twenty-four Japanese blooms, several competing. Mr. Coote, gardener to D'Arcy E. Taylor, Esq., Marshfield, was the winner of the first prize, with a fine stand of blooms. Particularly noticeable were Nellie Poekett, J. R. Upton, Lord Salisbury, Australie (extra), W. R. Church, Chas. Longley, and Matthew Smith. Mr. Strugnell was a good second, and Mr. Wright, gardener to R. Whitehead, Esq., third. The last named scored with twelve Japanese, distinct, staging fine blooms of Chenon de Leché, Mrs. G. Mileham, Swanley Giant (fine), and W. R. Church. Messrs. Coote and Bastin (gardener to Sir Alexander Henderson, Bart., Buseot Park) followed, also with good blooms. Mr. Bastin won with twelve incurved, distinct, showing very good flowers of General Symonds, Mrs. H. J. Jones, Mrs. W. C. Egan, and Madame Ferlat; Mr. Strugnell was second, in whose stand were fine blooms of Chas. Curtis, King of Yellows, Madame Ferlat, and Duchess of Fife; Mr. Wright was third. With six of one kind

the last named won with Mrs. Barkley, fine, but not developed; second, Mr. Bastin, with Mrs. Mease; third, Mr. Coote, with extra fine flowers of *Chenon de Leché*. There were also classes confined to district growers and amateurs, which displayed good culture, particularly in the latter section. In this the secretary and his son were successful in carrying off a first and second prize with excellent blooms.

For a group of *Chrysanthemums* Mr. Wheeler, gardener to Major Goddard, Swindon, was a very good first, blooms, arrangement, and finish being alike good. In the group of miscellaneous plants Mr. H. Wright showed a very bright and neatly executed arrangement of *Begonias*, *Carnations*, small, bright-leaved *Coleus*, and other plants in a groundwork of Fern. Mr. Bastin won with table plants; Messrs. R. Looms, Strugnell, and Wheeler with *Primulas*, *Cyclamen*, and *Begonias* respectively. Fruit was not extensively shown, but vegetables in collections were excellent, Onions, Cauliflowers, and Parsnips especially so.

Non-competitive exhibits from Messrs. Davis and Son, Swindon; Thos. Rigg, Reading; and R. Tucker and Son, Oxford, each contributing beautifully executed devices of the florists' art, and which helped to beautify the exhibition hall in a marked degree. Messrs. J. T. Bown and F. B. Davis are the joint secretaries, both gentlemen working assiduously to make the show interesting and successful, with but poor recompense from the Swindon public.

### Woolton, November 19th.

This excellent society fully maintained its high position as a show of great excellence. The aim of the stagers and exhibitors is to provide an exhibition of quality and artistic arrangement. In this they fully succeeded, having the credit of the prettiest show in the locality. To secure this very creditable position the following exhibitors were mainly responsible, and for which they secured first prize awards: F. H. Gossage, Esq. (gardener, Mr. J. Stoney), Woolton, twenty-four Japanese *Chrysanthemums*, dis. vars., of good size, depth, and freshness; twelve Japanese; five vases, containing good blooms; six vases of pretty single flowers; one Fern, with a fine *Goniophlebium subauriculatum*; one foliage, with a grand *Croton Montefontensis*, 7ft in diameter, superbly coloured; one Orchid, with *Cypripedium Spicerianum*, well flowered; two *Begonias*, fine quality; and vegetables. Sir W. H. Tate, Bart. (gardener, Mr. G. Haigh), Woolton, secured firsts for eighteen Japanese cut blooms of much merit; eighteen incurveds, massive deep blooms; one incurved *Chrysanthemum* plant, and six pots of *Cyclamen*. Mrs. Cope (gardener, Mr. T. Carling), Woolton, first for twelve incurved distinct; one Palm, with a fine *Kentia*; one flowering plant, with a good *Ixora coccinea*; one Orchid, with freely flowered *Cattleya labiata*. S. Sanday, Esq. (gardener, Mr. Jones), Woolton, for one basket and bouquet of *Chrysanthemums*. Mr. F. Stevens for sprays and buttonholes.

Mr. W. Wilson for one Japanese or reflexed *Chrysanthemum*; one pompon with a model trained variety; one *Anemone*, and six pots of single large flowered; two bunches black Grapes, with Black Alicante; two bunches white, with Muscat of Alexandria, of fine colour. P. W. Barr, Esq. (gardener, Mr. Keightley), Woolton, for three large flowering *Chrysanthemums*, remarkably well done, and for one single with a pretty variety. S. S. Bacon, Esq. (gardener, Mr. J. Rothwell), for Roman Hyacinths well flowered.

Col. R. Ireland-Blackburne (gardener, Mr. G. Hammond), Hale, contributed some fine fruit, winning for one dish dessert Apples; three culinary; three dessert; and single dish of Pears and one dish of stewing. Mr. T. Lunt, Halewood, staged some fine vegetables, winning the collection of eight kinds, and four other firsts. Mr. Brown secured the silver challenge cup, the gift of the treasurer, Neil Gossage, Esq., for six kinds of vegetables. Mr. J. G. Learoyd and his committee may be complimented upon their successful show.

### Bristol, November 19th and 20th.

The thirty-ninth exhibition held under the auspices of the Bristol *Chrysanthemum* Society on the above dates must be described as a great success, the large Colston Hall being thronged with visitors almost as soon as the doors were open, and the quality and number of exhibits being quite up to the usual high standard.

In the class for thirty-six Japanese cut blooms, Mr. F. S. Vallis won with a really superb stand. This noted grower also secured the special prize for the best exhibit in the show, and the medal of the National *Chrysanthemum* Society for the best bloom in the show, with the same stand. His varieties were Mrs. Mease, Mrs. Coombs, Madame Carnot, Mrs. Vallis, M. P. Radaelli, M. Pockett, Mrs. Barkley, Madame Louis Remy, T. Carrington, Mrs. Thirkell, Mrs. Stowe, J. Lewis, W. R. Church, Bessie Godfrey, Edwin Molyneux, H. E. Hammond, Madame R. Cadbury, G. J. Warren, Calvat's '99, Australie Mrs. B. Wilde, and Surprise. A more perfect stand would be difficult indeed to find. Mr. W. Macadam Smith had a very good stand for second place, but the flowers were not so large as Mr. Vallis'.

Mr. J. Runnacles was third, Mr. G. Drake fourth, F. W. Flight, Esq., fifth, and Mr. D. E. Taylor sixth.

For twenty-four large-flowered incurveds Mr. J. B. Hankey was first, his best flowers being *Ialene*, Duchess of Fife, Mrs. F. Judson, Countess of Warwick, J. Agate, Chas. Curtis, and Mrs. R. C. Kingston. Mr. W. G. Drake was a close second, Mr. Flight third. The smaller cut flower classes were well-filled, a very fine dozen being that with which Mr. Macadam Smith won in the class for twelve Japanese distinct.

The groups of *Chrysanthemums* were about as usual, made up of capital material, but hard and stiff in outline and a jumble of colours. Alderman Godwin, G. W. Harper, Esq., and Mrs. Vincent Ames were the principal prizewinners. For show plants Mr. J. West took first place, Sir Chas. Cove and Mrs. Coleman following in the order named. Ornamental foliage plants were well shown, as well as a fine lot of stove plants. Colonel Goss, Mr. F. Tagart, and Prince Hatzfeldt were amongst the winners in this section.

The fruit was one of the features of the show, some very fine Grapes for the late season being exhibited. For six dishes Mr. H. Jones won, Mr. F. Tagart and Colonel Vivian following. Alderman Davis' Muscats were very fine, while rarely is such a show of Apples and Pears seen as that which graced the tables here. Quite a number of vegetable classes were crowded out into the corridors, but the quality was so good that plenty of admiring visitors followed.

The wreath, bouquet, and table decorations are always well done in Bristol, and this year exhibitors surpassed even their previous efforts. In the hand bouquet class Mr. W. H. Coles' superb exhibit was greatly admired, while the veteran Mr. C. Winstone, Mrs. Rogers, and Messrs. Dobson and Co., all showed of their best.

In the grand tier were the Orchids and a number of trade exhibits, not for competition. Messrs. House and Son, of Westbury, had a fine exhibit of Violets, while the lovely *Carnations* put up by Mr. W. J. Godfrey came in for unstinted praise. This noted grower also put up a number of new and choice *Chrysanthemums*. Certificates for Orchids were awarded to Mr. Budgett for a magnificent variety of *Cypripedium insigne*, and to Mr. J. Barry for *Oncidium Forbesi*.

### Sutton Coldfield, November 19th and 20th.

The seventeenth annual exhibition of the Gardeners' Mutual Improvement Association was held on the above dates. Amongst the various non-competitive exhibits Mr. W. B. Grove, Wyndley Nurseries, Sutton Coldfield, arranged a collection of floral designs and plants. As usual, Mr. A. Jenkins, gardener to A. W. Wills, Esq., Claregate, Wyld Green, annexed first honours in the class for "a group of *Chrysanthemums* arranged for effect," and the National *Chrysanthemum* Society's Certificate of Merit was also bestowed upon Mr. Jenkins for the best exhibit of *Chrysanthemum* plants in the show (and the Silver Medal offered by Mr. H. J. Jones, Lewisham, to the same exhibitor for six blooms of *Chrysanthemums*, Japanese, any variety). The second prize fell to Mr. R. T. Parker, gardener to A. R. Dean, Esq., Moor Hall, Sutton Coldfield. In class 2 Mr. A. T. Frizwell, gardener to J. Bishop, Esq., Stanley House, Sutton Coldfield, was placed first for a worthy group of *Chrysanthemums*; second, Mr. W. Jones, gardener to Mrs. Hope, Doe Bank, Sutton Coldfield.

CUT BLOOMS made a brave show. For twelve Japs Mr. C. Link, gardener to the Trustees of Oscott College, Erdington, led with very good examples; second, Mr. F. Jackson, gardener to A. Pilkington, Esq., St. Bernard, Wyld Green. In the class for twelve incurveds, six varieties, Mr. A. Jenkins, the only exhibitor, was awarded the first prize. For six blooms, any variety, distinct, Mr. S. T. Parker secured the first prize; second, Mr. John Jones, gardener to Councillor T. Turner; and third, Mr. John Steeley, gardener to R. G. Blood, Esq., Erdington. For nine stems of natural grown *Chrysanthemums* Mr. A. Jenkins scored; Mr. F. Jackson second, and Mr. Joseph Walls, Little Aston Hall, third. For four bunches of single *Chrysanthemums* Mr. A. Jenkins led the way.

VEGETABLES.—Space will only allow of brief reference to this praiseworthy section of the show, and including as it did every class of exhibitor, with hardly a single inferior exhibit. For a collection of vegetables to be shown on the tables, 4ft by 3ft, and judged by points, and the prize money to be apportioned accordingly, Mr. C. Link, of Oscott College, scored with an admirable collection; second, Mr. Joseph Walls; and third, Mr. John Jones; an extra prize being awarded Mr. J. Steeley. For a collection of vegetables on a table 3ft by 3ft, Mr. A. Frizwell, Mr. F. Jackson, and Mr. W. Vaughan were placed as in order named. In class 48, for a collection, as per the last conditions, Mr. John Delville, Mr. Thos. Beavon, and Mr. W. Vaughan were the respective winners. Potatoes were shown in collections of six, four, two, and single dishes. For six varieties Mr. C. Link was to the fore with super-excellent examples of kidneys and rounds; second, Mr. John Melville; and third, Mr. J. Steeley.

For four varieties, two kidneys and two rounds, Mr. H. Fulford, Erdington, led. Apples and Pears, three dishes distinct, were exhibited by several competitors in fairly good form considering the district and the past untoward season. A Certificate of Merit was awarded to Mr. F. Jackson for two bunches of black Grapes.

### South Shields and Northern Counties, November 19th and 20th.

After a lapse of five years this society has sprung into life again with renewed energy, and held a magnificent show in the Royal Assembly Hall (a grand and spacious building) surrounded by all the associations of the past. Mr. Bernard Cowen, F.R.H.S., as hon. secretary; Mr. Thos. Binks, assistant hon. sec.; Councillor T. Whitfield, chairman of the committee; Mr. Alex Purvis, chairman of the General Purposes Committee; with the hon. treasurers, Mr. J. T. Reed and Mr. E. E. Walton, were one and all present, and assiduous in their endeavours to make the show a success. They were fortunate in securing James Readhead, Esq., J.P., as their President, who, in offering a Silver Coronation Cup of the value of £15 15s., a splendid work of art, proved his interest in the society. There were also no less than five other five guinea Coronation Cups offered, besides a beautiful gold cross medal, and other special prizes. The exhibition was opened with great éclat by the Mayor, Councillor J. Grant, who was introduced by the president, and accompanied by the Mayoress, Miss Grant, and Mrs. J. Readhead, who were each presented with splendid bouquets, and supported by a large number of the officials, with their ladies, which augurs well for the success of the exhibition.

**Cut Blooms.**—The principal interest was centred in the class for thirty-six Japanese, not less than eighteen varieties, the first prize being the President's Coronation Challenge Cup, valued £15 15s., and prizes of £6, £4, £2, and £1. This brought out the champion grower, Mr. F. S. Vallis, Bromham, Clippenham, who easily secured the first prize with a fine, solid, bright lot of the following: Madame Carnot (2), Calvat's Sun, Mrs. Barkley (2), Ed. Molyneux (2), T. Carrington (2), Mrs. J. Lewis (2), M. Louis Remy (2), M. Chenon de Leche (2), G. J. Warren (2), Chas. Longley, Calvat's '99, W. R. Church, Paola Radaelli (2), Mrs. Coombes (2), Mrs. Mileham, Mrs. Mease (2), Mrs. Hummell (2), Surpassé Amiral, Nellie Pockett (2), Ethel Fitzroy, C. J. Salter, W. R. Church, and Marquis V. Venosta (very large). The second prize fell to Mr. A. Findlay, The Gardens, Grey Towers, Nunthorpe, with a fresh, even stand. Third, Mr. Geo. Shotton, The Gardens, Swarland Hall, Northumberland. Fourth, Mr. MacDougall, gardener to H. Pease, Esq., Arcot Hall, Dudley, the latter being exhibited on too large a board, and many were past their best. (Mrs. Mease in Mr. Vallis' stand, was selected as the premier bloom in the exhibition, and won the bronze medal.)

In the class for eighteen Japs in twelve vars. Mr. Vallis was again first with a grand lot, composed chiefly of the same varieties as in the larger class, with the addition of the variety Guzie. The second prize was secured by Mr. A. Appleton, gardener to S. Spencer, Esq., Bellington. Mr. MacDougall third. For twelve Japs, Mr. A. Appleton was first; Mr. S. Sprout, gardener to John Whate, Esq., Low Fell, second; and Mr. MacDougall third.

The classes for incurveds were much weaker than the Japs, many of the blooms showing a want of finish, partly owing to the backward season. In the class for thirty-six, not less than eighteen vars., for which a Silver Coronation Cup, valued £5 5s., and prizes of £6, £4, £2, and £1 were offered, there were only two competitors, Mr. Shotton securing the first, and Mr. J. Coultas, gardener to W. Harding, Esq., Hollyhurst, Darlington, second. In the class for eighteen incurves Mr. G. Shotton was again first. There were some very good stands of Anemones and reflexed flowers shown by Mr. T. M. Petch, which secured the first prizes in each class.

**Group.**—For a group of Chrysanthemums and other flowering and foliage plants arranged for effect in a space 10ft by 6ft, a silver Coronation Cup, valued £5 5s., and prizes of £5, £3, and £1 10s. were offered. There were three competitors, and Mr. Geo. MacDougall secured the first with a showy group, that contained some bright Crotons and clean Palms, interspersed with Cyrtipediums, Begonias, Primulas, &c., in the front, with some fine blooms of Chrysanthemums arranged under a Palm at the back. The second was awarded to Mr. T. M. Petch, gardener to Mrs. Rennington, Mona House, Sutton-on-Hull, with a lighter arrangement, the Cocos Palm being elevated on cork, and dells formed of low growing plants, edged with Cineraria maritima; but there was a sad lack of colour and brightness in the whole arrangement. The group of Mr. T. Reay, which contained some fine Chrysanthemum blooms, was placed third.

**Bouquets and Epergnes.**—The bouquets exhibited at South Shields are generally of exceptional merit; the display is such as is rarely seen South. This year they were quite up to the standard, being marvels of artistic skill, and formed quite an exhibition in themselves.

For a hand bouquet, Mr. James Summers, Florist, Sunder-

land, was first with a choice arrangement, containing flowing sprays of Oncidium varicosum, Odontoglossums, Cattleyas, Dendrobiums, Pancratiums, &c. Miss Battenby, Hagg Hill, Blaydon, second, with a similar arrangement of choice flowers: with Miss Dora Summers third.

In the class for bridal bouquets the same taste was displayed, and the prizetakers followed in the same order, the competition being very close. The epergnes were also of the very choicest, Cattleyas, Oncidium, Cyrtipediums, Odontoglossums, and other Orchids lightly and elegantly arranged formed an exquisite combination, the whole being very attractive to the large number of visitors. Mrs. James Summers, Miss Battenby, and Miss Dora Summers being successful in the epergne classes, and also for sprays and buttonholes. Messrs. Clibran and Son, Manchester, exhibited a non-competitive group of cut blooms of Chrysanthemums in vases, pots of Lily of the Valley and Celosias forming a bright and attractive display in front of the orchestra. Messrs. Ord, of North Shields, also exhibited a fine bank of plants and flowers. Some good Grapes and vegetables were shown, but the competition for these was not so strong as in former years. The judges were Mr. Geo. Gordon, V.M.H. and Mr. C. Orchard, F.R.H.S., Bembridge, I.W.

### Dulwich Chrysanthemum, Nov. 11th, 12th, and 13th.

The ninth annual exhibition of the Dulwich Chrysanthemum Society may again be recorded as a great success. Over 2,000 people, irrespective of members, visited the show during the three days. A larger number of entries were received than ever before, and the competition throughout was very keen. One hundred and twenty-four exhibits were staged in thirty-three classes by no less than fifty different members. The Coronation classes for twelve Japanese blooms in four vases, three blooms of one variety in each, brought up some fine exhibits. The gardeners' section, with four entries, had Mr. W. Taylor first (gold medal presented by Norman Davis, Esq.), Mr. A. Winter second, and Mr. A. M. Falkner third; while in the amateurs' section Mr. A. M. Falkner was first and Mr. A. Shinn second. Mrs. Mileham, Miss Alice Byron, and W. R. Church being very strongly represented in these classes.

The large gardeners' groups showed a falling off in numbers, but the quality left nothing to be desired. Mr. A. Winter, gardener to E. Manwaring, Esq., of Elm Lodge, College Road, Dulwich, was again first, and Mr. G. Houlton second. Mr. A. Winter was also second for twelve Japanese, second for six Japs, one variety, third for vase of seven blooms, and third for one Japanese and one incurved, as well as second in Coronation Class. Mr. W. Taylor, gardener to C. Bayer, Esq., of Tewkesbury Lodge, Forest Hill, secured firsts for twelve Japanese and vase of seven blooms, as well as the Coronation class, second for one Japanese and one incurved, and thirds for six bush plants, six foliage plants and basket of Chrysanthemums. Mr. T. Martin, gardener to W. Harvey, Esq., Fairfield, Dulwich Village, won firsts with six bush plants, six Japanese distinct, six Japanese, one variety, six Anemones, and one Japanese and one incurved, and second for vase of seven blooms. Other prominent prizetakers in the gardeners' classes were Messrs. G. Houlton, C. Bellis, and E. Rea.

Amongst the amateurs, Mr. A. M. Falkner was again facile princeps, for besides winning the Amateur Coronation class and taking a third in the Gardeners' Coronation class, he took firsts for six incurves, vase of six blooms, one Japanese and one incurved, and for basket of Chrysanthemums he was first in both amateur and gardeners' section; the basket shown in the latter eliciting well-deserved commendation from the judges.

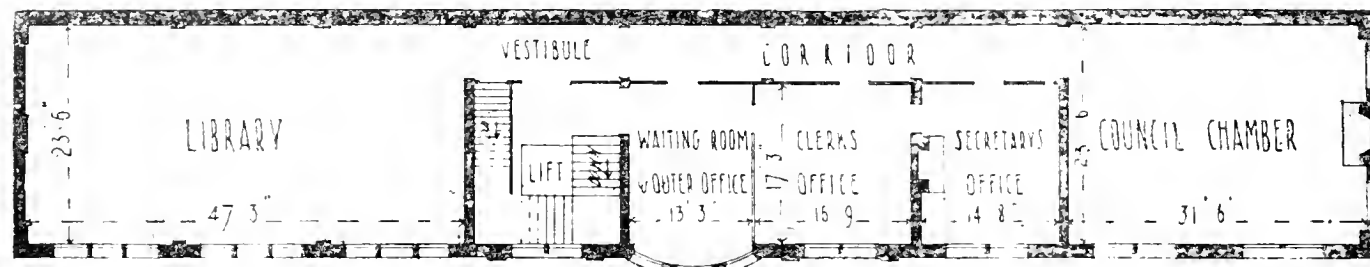

The large amateur groups were again strongly represented, Mr. R. J. Starsmeare winning with a very good group, with Mr. H. F. Foster and Mr. T. Bradbury second and third respectively. The groups of twenty-four plants brought up a very strong entry, Mr. J. Tavener winning, with Mr. H. Wells second, and Mr. R. Parfitt third out of six entries. The amateurs were very strongly represented amongst cut blooms, and the quality was throughout good. Mr. C. W. A. Banks was first for twelve Japs, and Mr. H. Wells for six Japs. Amongst the novices Mr. J. Falkner was prominent in all the classes, and the keenest of competition was shown, three out of the four classes bringing up from seven to nine entries.

Perhaps the feature of the show which produced the greatest improvement was the decorative classes, four to five entries being staged in each of the five classes devoted to epergnes and baskets, the effect produced being a very striking one, and the quality of the exhibits exceptionally meritorious. The Florence Molyneux exhibited by Mr. A. Winter was judged the premier bloom, and C. H. Curtis, shown by Mr. A. M. Falkner, the best in the amateur section, and James Bidencope, shown by Mr. J. Falkner, the best novices' bloom. A large group of Chrysanthemums, staged by Mr. R. Forster, of Nunhead Cemetery, received a well-deserved silver-gilt medal. The platform decorations by Messrs. Peed received a similar award. The judging, which was in the able hands of Messrs. Waterer and Norman Davis, it need hardly be said, gave the greatest satisfaction.

SECOND FLOOR PLAN

Plans of the Royal Horticultural Society's Proposed Hall.

### Hardy Fruit Garden.

**RASPBERRIES.**—The best of the numerous suckers which may now be found in the Raspberry quarters can be utilised for forming a new plantation. The strong, succulent-looking canes are not really the best for planting, because they are not so well furnished with fibrous roots, but have long, thick roots, prone to descend and make growth in the subsoil rather than branch out laterally and multiply into a number of fibres. The smaller and thin-looking canes, on the other hand, have abundance of these desirable fibrous roots, and as these are much more serviceable for the future welfare of the plants, by all means select canes of this character for planting. They are chiefly to be found at some distances away from the main stools. The readiest manner of selecting, however, is to lift all the suckers and pick out the best for planting, laying them in to keep the roots from drying. In addition to the removal of suckers from between the clumps or rows of Raspberries, the canes should be thinned out, retaining the strongest and most vigorous for future bearing. The weak canes in this case are not desirable. When in lines the canes may be left, so that they can be tied in to about 6in apart. In clumps, five or six strong canes are sufficient. Side shoots have in some cases started from the canes. These must be shortened back to the leaf axils. Canes should not be left to their full extent, as their upper parts are attenuated and fail to ripen. It is usual to shorten them to the tops of the stakes or trellis, which are about 5ft high. The canes are or ought to be well ripened to this point. After pruning and cleaning established quarters, spread over the soil between the plants a liberal mulching of rich manure. During mild periods in winter liquid manure may be applied to the soil with beneficial results.

**PLANTING GOOSEBERRIES.**—In preparing the soil for these the treatment must be generous in every respect. Deeply dig or trench the ground and loosen the subsoil. Intermix thoroughly decomposed manure with the soil, which should be broken up and pulverised when in a half dry condition. Small bushes, two or three years old, are the best for forming a plantation. Though the trees look small when planting, they should be inserted at a distance which does not permit of ultimate crowding. Six feet apart is a suitable distance. For a year or two other crops of an annual character may be grown between, or a row of Strawberries. Gooseberries, with single, double, or triple stems, are admirably adapted for wall or fence planting. They may be grown in this manner where space is limited, or to supplement the ordinary plantations of bush specimens. Walls of any aspect can be furnished, but it is usual to grow them on north or east walls, so that a late crop may be secured.

**THE METHOD OF TRAINING** may be upright, each branch or cordon having a space of 6in between it and the next. As the growth of Gooseberries is vigorous, especially in good soil, three-branched cordons are practically the best, and should be inserted 18in apart. Single cordons, of course, only 6in. Side shoots are produced freely each season, and must be summer-pruned to six leaves, as a means of concentrating the vigour in the basal buds, furthering shortening in winter to about an inch. The method of pruning for bush trees may be less formal, allowing a larger number of young shoots to extend, removing the extreme or unripened tips. Keep the bushes fairly well open in the centre, and prevent the branches touching the ground by clearing away the lower growths. Where plantations of Gooseberries have in former years been planted thickly it is desirable to thin the trees themselves out previous to severely pruning.

**RED AND WHITE CURRANTS.**—The details of culture as regards these fruits are precisely the same as for Gooseberries, with the exception that the annual winter pruning is based on one special line of treatment only. This consists of originating while the trees or bushes are young, a definite number of branches, five or seven being a suitable number to form a medium-sized bush. These main branches may each year have the leading shoot encouraged to extend during the summer, but in the winter shorten back to 10in. On the older part of the same branch side shoots push, as they are encouraged to do so by the shortening of the leader previously. The side shoots must be summer-pruned, as described for cordon Gooseberries, and in winter be similarly pruned or spurred in. Red Currants are excellent for cordon treatment on walls and fences.

**BLACK CURRANTS.**—These are only profitable on the bush system, so that young wood may be freely produced, and a good

selection of it retained annually for fruiting. The older parts of trees, or the previous season's bearing growths, may be cut out. Plant two or three year old bushes on ground prepared as for Gooseberries, and at similar distances apart. When bushes cease to produce strong young shoots they are not profitable.—EAST KENT.

### Fruit Forcing.

**CUCUMBERS.**—At this time of year continued firing is needful, and where the heat is radiated at a high temperature the atmosphere is dried more than is good for the plants, either at the roots, when the beds are near the hot-water pipes, or the foliage in the immediate vicinity. In consequence of these circumstances the roots become stunted and swell irregularly. Careful attention to watering and damping is the only palliative under such conditions. Ventilation also needs careful attention, affording it whenever a favourable opportunity offers, but excluding air when the external atmosphere is sharp and cold. In bright weather turn off the top heat when the sun is powerful and likely to raise the temperature above 85deg or 90deg in such weather, damping the house morning and afternoon, and closing early. In damping care must be taken not to wet the embryo fruits, as they will damp off if water remains on them or hangs from their points for any length of time. Water will be required at the roots about twice a week. Maintain a temperature of 60deg to 65deg at night and 70deg to 75deg by day.

**WINTER FRUITERS** or plants from August or September sowings, having grown to the extent of the trellis, will have produced some, and have abundance of fruits showing or swelling. It is not, however, a good plan to allow the plants to bear to any great extent for some time, unless there is a pressing demand for fruit, and then the cropping will tell disastrously on the supplies later. Winter Cucumber plants cannot be too sturdy in growth and too thick and leathery in the leaves, but they may be too luxuriant, and in that condition highly susceptible of atmospheric changes. Attend to stopping and tying frequently, thinning to avoid overcrowding, allowing space for the unshaded development of the foliage. If canker appears in the stem, subdue by rubbing quicklime into the affected part, removing bad leaf and decayed growth promptly, rubbing a bit of the lime on the wounds. If mildew appear, dust with flowers of sulphur, it being well to dust some over the plants with a view to its prevention.

**WHEN WHITE FLY IS FIRST SEEN**, a little sulphur, formed into a cream with skim milk, should be brushed on the hot-water pipes; this is equally effective against mildew and "spot" fungus, which sometimes causes brown streaks and spots on the fruits, and then they grow crooked and have hard flesh in places. Sulphur fumes are also disagreeable to red spider, and in nowise inimical to Cucumbers unless the pipes are too highly heated and the fumes given off for a prolonged period at a high temperature. Aphides should be destroyed by vapourisation with nicotine or fumigation with tobacco, being careful not to give too much vapour or smoke. It is best to vapourise or fumigate on two or three successive evenings moderately, or, preferably, follow the evening with early morning treatment, choosing calm weather.

**MELONS.**—Fruits on the latest plants are beginning to net and will be ripe during December. To swell them off they require a rather moist genial condition of the atmosphere, damping the house in the morning and early afternoon, admitting a little air early in the forenoon to insure the dispersion of moisture and induce evaporation from the foliage. Maintain the night temperature at 60deg to 65deg, 70deg to 75deg by day, advancing to 85deg or 90deg, and as much as can be had, after the sun passes the meridian. The plants should have liquid manure about once a week. Plants that set the fruit in September are now ripening. The house should have air constantly, and a temperature of 70deg to 75deg by day, and more heat, with a free ventilation, when the external conditions are favourable, yet husbanding the sun heat, but not closing the house, withholding water from the atmosphere and roots. Fruit, though not of high flavour, proves acceptable from variety at this time and up to Christmas or later.

**PEACHES AND NECTARINES: EARLIEST HOUSE.**—To have ripe fruit in April or early in May a start should be made at the beginning of next month. Alexander and Waterloo, both very early varieties of Peaches, giving fruit about three weeks earlier than Early Louise, and a month or more before Stirling Castle and Royal George. Of Nectarines Cardinal is the earliest, and forces admirably. The trees having been at rest some time, and previously forced, will start promptly, but those not before started early will not respond so quickly; therefore, the house should be kept close, but admitting air freely above 50deg, employing fire heat only to prevent the temperature falling below 35deg. The more slowly the trees are excited the stronger will be the blossoms. The outside border must be protected to exclude frost, for the roots cannot absorb nourishment from the

soil when it is frozen. A thorough soaking of water should be given to the inside border, though this will not be necessary where the roof lights have been off some time; and if the trees are weakly a soaking of liquid manure (not too strong) will tend to a more vigorous break. Sprinkle the trees in the morning and afternoon of bright days, but do not keep them dripping with moisture, especially at nights, for this has a weakening tendency, and tends to encourage wood rather than blossom development.

**SUCCESSION HOUSES.**—All the leaves are off the trees except in the latest house, where they still hang somewhat unduly, probably from the dull and wet weather, also absence of frost, but they should not be forcibly removed. When, however, they come easily by brushing with the hand or a light broom the process may be assisted, and when they are all off, unfasten the trees from the trellis, prune them, cleanse the house thoroughly, and, if needed, paint the woodwork, ironwork, and the trellis. Wash the trees with soapy water, and afterwards dress them with an improved insecticide, but do not dislocate the buds. Tie the trees to the trellis, leaving room for the branches to swell. Remove the loose surface soil and supply fresh, giving a top-dressing of some approved fertiliser, and supply water to the inside borders, so as to keep them thoroughly moistened down to the drainage. Keep the atmosphere of the houses as cool as possible.

**LIFTING AND ROOT-PRUNING FRESH TREES.**—Any lifting, root-pruning, or other root requirements of the trees should be attended to without delay; but it is not safe to interfere with too vigorous trees until the leaves are all down or nearly so, a few soft growths, especially laterals, being of no consequence, as they will have to be removed. The introduction of fresh trees should be performed at once, the planting being proceeded with as soon as the leaves are off. Trees for houses are best if trained for two or three years to walls or under glass, those of five or more years moving safely if prepared for lifting by digging round them, so as to cause the production of fibres, a year previously. Such trees can be lifted with abundance of roots, and, being carefully planted, they force readily the first season, and the results are satisfactory, provided they are not brought on too rapidly, and a moderate crop taken. It is always preferable to select trees coming into profit, as young ones do not fruit much the first two or three years; hence the advantage of planting trees in a bearing condition.—ST. ALBANS.

A very dull dark week, with cold east wind.

### Trade Catalogues Received.

Clibrans, Altrincham.—1, *Select List of Chrysanthemums*; 2, *Trees and Shrubs, Roses and Fruits*.

M. Herb (Herb and Wulle), Seed and Bulb Grower, Naples, Italy.—*General Catalogue of Seeds*.

Hogg and Wood, Nurserymen and Seedsmen, Coldstream and Duns, N.B.—*Nursery Stock*.

A. C. Rogers, F.R.H.S., Camp Vale, Sheakespeare Avenue, Portwood Road, Southampton.—*Trees and Shrubs, Roses, &c.*

\* \* All correspondence relating to editorial matters should be directed to "THE EDITOR," 12, Mitre Court Chambers, Fleet Street, London, E.C. It is requested that no one will write privately to any of our correspondents, seeking information on matters discussed in this Journal, as doing so subjects them to unjustifiable trouble and expense.

### Plan of a Bothy Competition.

"Well-wisher" promises a first prize of £3, and the Editor supplies a second prize of £1.

The rules of the competition are as follows:—The plan, drawn to scale, must not exceed 7in broad by 7in deep, and must be clearly defined on stout paper. The plan must provide suitable accommodation for six men, and the cost of the building ought not to exceed £200 to £220. A statement of the general items of cost should accompany the plans, together with any written comments thereon. The competition is open until Christmas, 1902, by which date all plans must be in the hands of the Editor. The sender's name and full address should be enclosed when sending the plan, and the sender will alone be held responsible for it.

**MILK? BUTTER? CHEESE?**—In the article under this heading on page 486, line 24, sec. col., last week, the sentence beginning: "The milkman is always in trouble," should be "in touch."

**CERATONIA SILIQUA (D. W.).**—Gerarde says:—"I have sown the seeds in my garden, where they have prospered exceedingly well. It has often been grown in South England on south walls, and you might try it, but there is not much prospect of its surviving severe winters."

**ARTIFICIAL MANURE FOR LAND CONTAINING MUCH CHALK OR LIME (A. Weekly Reader).**—Nitrate of soda, 2 parts; dried blood, 2 parts; dried fish, 2 parts; steamed bone-meal, 4 parts; superphosphate, 4 parts; nitrate of potash, 2 parts; and wood ashes, 4 parts, mixed. This mixture contains  $3\frac{1}{2}$  per cent. of nitrogen,  $7\frac{1}{2}$  per cent. phosphoric acid, and  $6\frac{1}{2}$  per cent. of potash. It may be used at the rate of 5 to 10 cwt. per acre,  $3\frac{1}{2}$  to 7lb per rod, for gardens, or  $2\frac{1}{2}$  to 5 cwt. per acre for field crops. The blood and fish should be ground and the nitrate crushed, the wood ashes facilitating the mixing and distribution of the fertiliser, as well as supplying sound potash and phosphoric acid.

**SPORTING OF CHRYSANTHEMUMS (J. H. S.).**—No one has yet given a satisfactory explanation of sports, and certainly that of its being due to fertilisation of the flower is remarkable, and our experience negatives the dictum, as we have had many sports from plants the parents of which had not their flowers fertilised artificially; and if so, naturally the flowered stems were cut off as soon as the flowers faded, thus giving little opportunity of the sap descending to the rootstocks and changing the nature of the sap and characteristics of the suckers. No doubt fertilisation results in sports, but it is often embryonic plant in the seed, and the plant from it may vary from one or both parents, and even afterwards give rise to other variations, termed sports, common not only to plants resulting from cross-fertilisation and in varieties most advanced in the florist's estimation, but also in species, hence certain parts of an Oak producing green leaves may and do produce silver or golden variegated leaves, even the common Holly producing variegated parts in a state of nature, and no one knows or has explained why.

**CARNATION LEAVES DISEASED (C. C.).**—The leaves are infested with the black mould known scientifically as *Macrosporium nobile*, and commonly as "spit" fungus. It has been very common this season, both outdoors and under glass, and this probably from the dull and cold and wet nature of the summer. The spots are irregularly scattered, and the mycelium of the fungus is widely diffused in the tissues before the discoloured spots appear on one or both surfaces of the leaf or even stem, and on these are produced still darker minute specks, which represent clusters of conidia, or spores, by which the disease is spread in summer, or even in winter under glass. Later in the season numerous minute black sclerotia are embedded in the diseased parts of the plant, and these carry over the disease so that it starts anew the following summer. Spraying the plants with a solution of ammoniacal carbonate of copper, or of potassium sulphide, arrests the spread of the disease. Potassium sulphide should first be dissolved in hot water, say  $\frac{1}{2}$  oz in a pint of hot water, and when dissolved dilute with cold soft water to 1 gal. All diseased parts or leaves should be picked or cut off and burned, thus preventing the formation of sclerotia.

**SCOTS FIR COVERED WITH IVY** (Subscriber).—As the Scots Fir is considerably over a century old, and the bole and some of the branches covered with Ivy, thus asserting its supremacy as a "parasite of support" to such extent that some of the branches are dying, we do not think it would be good policy to cut away the Ivy, as the Scots Fir is not likely to recuperate much, if any, in consequence, therefore the better plan would be to leave the tree in its glory of age, and thus prolong the feature as long a period as possible. With the Ivy the Scots Fir would probably linger on some time, and the Ivy would gain correspondingly, and be for some time after the demise of the Scots Fir an evergreen feature of no little interest and beauty. Spare both Scots Fir and Ivy.

**FURNACE OF WATERWAY END SADDLE BOILER NOT DRAWING** (S. J. D.).—So far as we can make out from your rough sketch, the boiler does not draw simply because the bottoms of the side flues are below that of the openings at the sides of the boiler, this causing a check on the draught; otherwise the setting appears all right, the flues (6in) being wide enough, and not being more in depth than 1ft there will be a rise at the doorway end from the side flues into the over-boiler flue, and thus an equal flue space being allowed at the doorway end of the boiler as in the side flues, and the over-boiler flue not throttled where it passes into the chimney, we do not see why the boiler should not draw. The damper, of course, will be in the chimney, and is best at least a foot above the over-boiler flue. The flues will follow the course of the boiler, and they should be properly separated—the side flues from the over-boiler one.

**NAMES OF FRUITS.**—*Correspondents whose queries are unanswered in the present issue are respectfully requested to consult the following number.* (E. W.).—1, Northern Sweet; 2, King of the Pippins; 3, Northern Greening; 4, Alfriston; 5, Potts's Seedling; 6, Withington Fillbasket.

**NAMES OF PLANTS.**—*Correspondents whose queries are unanswered in the present issue are respectfully requested to consult the following number.* (J. B.).—1, *Luculia gratissima*; 2, *Tibouchina macrantha*; 3, *Acacia platyptera*; 4, *Rhodochiton volubile*; 5, *Gymnogramma grandiceps*. (Fern-lover).—1, *Platynerium alcicorne*; 2, *Davallia hirta cristata*; 3, *Nephrolepis pectinata*. (N. T.).—1, *Garrya elliptica*; 2, *Azara microphylla*; 3, a Birch; 4, *Daphne Laureola*. (D. G., Yorks).—1, Rose, probably Mrs. Mawley (send to a specialist); 2, *Hibiscus syriacus*; 3, not recognised. (B. B.).—1 and 3, useless for naming by; 2, *Tradescantia virginica*; 4, *Daphne Mezereum*.

## Covent Garden Market.—November 26th.

### Average Wholesale Prices.—Plants in Pots.

Most of the undermentioned plants are sold in 48 and 32-sized pots

## The Winter Quarter.

The problem how to keep down expenses and still keep up the work of the farm during the winter quarter is the most difficult that the modern farmer has to solve. Horses have to be fed whether they are working or not, and the profitable use of farm horses has a very close relation to the successful cultivation of arable land. On very few farms nowadays is the horse-power an ample one; that is, sufficient for all purposes and a little to spare. We can remember the time when farmers could afford to keep their stables full of good horses, many of them eating their heads off in the way or corn; but matters are sadly different now, and every quarter of horse corn must be strictly accounted for if the balance sheet is to present anything like a decent appearance.

The first lesson to be learned from this is that we must keep no more horses than necessary; at any rate, at work, and if we keep horses in idleness they must either be breeding mares of high pedigree or young growing colts not yet mature for much work. Days are too short to admit of a full tale of work, and unless the weather be very cold the proportion between food and work may be maintained by reducing the corn allowance. This often is as much as 14lb per day when the horses are working hard; but it may be reduced to 10lb until February 1, and then gradually increased again. Twenty-eight pounds per week, costing about 1s. 9d., does not appear much, and there are plenty of people who would consider it not worth bothering about; but it is useless for us to grumble about farming being unremunerative unless we do our best in every way to make it otherwise.

If a farmer is working twelve horses he will save one guinea per week, or thirteen guineas in the quarter, by their reducing the winter corn, and thirteen guineas is not easily earned by agriculture. When reducing the corn, however, we should somewhat change its character. During winter horses require more fattening food, and we should reduce the bran to the smallest allowance. Split Maize mixed with a smaller quantity of Wheat or Barleymeal, say two-thirds to one, would not be too heavy a food for good constituted animals. For those which are subject to outbreaks of humour the use of bran should be continued. In districts where the annual servants' hiring take place at Martinmas it is not uncommon nowadays for a farmer to turn two or three horses into a yard or paddock for a rest on cheap rations until the days materially lengthen. They hire a man less than usual, and thus save his wages for two or three months until the horses are again put into work. This plan is a useful one where several two-year-old colts or fillies are included in the team. Winter is the time when they are of the least use, and so they can well be spared. But much depends on the state of the farm work, whether it is forward or the contrary, as it is very unwise to reduce the working staff when much remains to be done.

It is not strange that farmers complain of labour being costly and difficult to obtain when they so often make wasteful use of it. Only the other day we noticed three ploughs at work on a piece of stubble land. One was a digger with a chilled breast; the other two were old fashioned wooden swing ploughs. The work done by the digger contrasted most favourably with that by the others, and on examination of the furrows showed that it was doing nearly as much work as the two put together. The foreman who was in the field explained that the swing ploughs were used because he only had one digger available. The saving was about 7s. per day on the one pair of horses, and we reckoned that an additional digger would save its own cost in little more than a fortnight. Some farmers have a prejudice against putting aside implements until they are quite worn out, quite regardless of the patent fact that by doing so and using obsolete tools they are penny wise and pound foolish.

We know a man who never stayed many years on one holding, but who removed to pastures new at almost regular

periods. He maintained that the expense of moving was fully compensated by having a sale and relieving himself of a quantity of old, out of date machinery and useless lumber. But it should be quite possible to attain that without leaving the farm, and at this time of year a looking over of the implements, with a resulting weeding out of much useless lumber for sale to the nearest broker, would both improve the appearance and add to the convenience of the implement shed on many farms. How often we see costly machinery left out in the fields long after it has been in use. This is especially noticeable in the case of harrows and horse-hoes. Foremen forget what an increase of wear arises from such unnecessary exposure.

If the shed were cleared of unnecessary rubbish there should be ample room for all articles not in actual use. The winter quarter is an expensive and anxious time for the cattle feeder; but the greater plenty of roots and fodder will make his anxieties during the approaching winter much less acute than they have been in recent years. There is one trouble still pressing, and that is the high price of cakes. With so much damaged corn, and plenty of straw to cut up, it would be a wise course to use meals freely as cake substitutes. For animals over twelve months, and for cows and heifers in calf, meal with roots and chaffed straw may largely reduce the cake bill. There is more damaged grain on the market already than there is demand for, and it would be suicidal to buy dear cake and flood the markets with corn which might be used at home in its place.

A feature of winter is the feeding of bacon pigs, and it is at present most profitable; but there are signs of a turn of the tide. Small pigs are much more plentiful, and almost reasonable in price. They are decidedly worth buying unless pork is much cheaper in the spring, for pigmeal will be plentiful, and offal Potatoes are always with us. They can be bought for 20s. per ton, and we would rather speculate in pigs and them than in the new Northern Star Potato at 10s. per lb. The latter smacks too much of advertisement to suit our taste.

### Work on the Home Farm.

Delivery of Potatoes has been one of the chief occupations of the week; all the spare hands have been occupied working the machine riddle, and twelve to fourteen tons per day has been the result. The Potatoes are an excellent sample, and it is some time since there was so little disease, but the crop is decidedly light.

The horses not occupied in carting Potatoes away are ploughing fallows and carting Turnips for the beasts which are now up from grass. There will be Turnips and to spare for everything. Swedes have grown enormously during the past month, and we should like to have some stored, but they appear too full of growth as yet. There is another reason for delay in the fact that we are shorthanded, owing to the Martinmas holidays. Wages are supposed to be a little easier, but men are as difficult as ever to obtain, and even more independent and dictatorial. Many of them will not rehire themselves immediately, but wait awhile, so as to extend their holiday. Meanwhile the labourers have to feed and work the horses, and other work has to be left for more convenient seasons. Thus the hedging work, which requires attention, must wait.

We shall put some basic slag on a field of low-lying peaty land very soon. We shall have to use a drill, for even when well damped, sowing it is objectionable work, and men will scarcely undertake it.

Steam cultivators are at a premium, and we may not get our ley cultivated before Christmas. This is serious, for it is time the work were done, but it is unavoidable. New tackle cannot be obtained, as manufacturers are full of Government and other work, so we must wait patiently. The soil is somewhat heavy, and requires all the frost action it can have. We might dig it over with chilled ploughs, three horses in each, but it is very heavy work, and the horses have had a hard time since harvest.

## Webb and Sons' Root Competition.

The awards in the above competition for the valuable prizes offered by Webb and Sons, the King's seedsmen, Wordsley, Stourbridge, for root crops grown from their seed and with the aid of their special manure have just been issued. The judges were: Mr. F. Horne, Salters Hall, Bobbington, Stourbridge; Mr. Morgan Jones, Delbury, Craven Arms; Mr. H. Wilson,

Gatacre, Bridgnorth; and the following is a copy of their awards:—

DISTRICT 1.—Five acres of Webb's Swede, open to the counties of Salop, Stafford, Montgomery, Warwick, and Leicester. First prize, £15 15s., Mr. J. B. Ball, Knightley House, Eccleshall, Staffs, 50 tons, 4cwt 1qr 4lb per acre; second prize, £10 10s, Mr. Alfred Hocknell, Norton House, Stone, Staffs, 47 tons 2cwt 3qr 12lb per acre; third prize, £5 5s, Messrs. Francis Bros., Leighton Farm, Welshpool, 44 tons 5cwt 2qr 24lb per acre.

Three acres of Webb's Mangold. Prize, £5 5s., Mr. Richard Preece, Cressage House, Shrewsbury, 60 tons 1cwt 1qr 20lb.

DISTRICT 2.—Five acres of Webb's Swede, open to the counties of Hereford, Monmouth, Brecon, Glamorgan, Carmarthen, and Pembroke. First prize, £15 15s., Mr. J. Thomas, Tile House, Boverton, Cardiff, 42 tons 17cwt 0qr 16lb per acre; second prize, £5 5s., Mr. Rees Thomas, Boverton Place, Boverton, Cardiff, 39 tons 5cwt 2qr 24lb per acre.

Three acres of Webb's Mangold. Prize, £5 5s., Mr. Philip Price, Howick Farm, Chepstow, 93 tons 14cwt 1qr 4lb per acre.

DISTRICT 3.—Five acres of Webb's Swede, open to the counties of Oxon, Berks, Bucks, Wilts, Hants, Surrey, Worcester, and Gloucester. First prize, £15 15s., Mr. W. M. Harvey, Allington Manor, Bishopstoke, Hants, 31 tons 2cwt 3qr 12lb per acre; second prize, £5 5s., Mr. Edward Parsons, Wollaston Farm, Stourbridge, 30 tons per acre.

Three acres of Webb's Mangold, open to the counties of Oxon, Berks, Bucks, Wilts, Hants, Surrey, and Worcester. Prize, £5 5s., the Most Noble the Marquis of Downshire, Easthampstead Park Farm, Wokingham, 65 tons 11cwt 1qr 20lb per acre.

DISTRICT 4.—Three acres of Webb's Mangold, open to county of Gloucester. Prize, £5 5s., Mr. Thomas R. Chew, The Callow, Dymock, 72 tons 5cwt 2qr 24lb per acre.

DISTRICT 5.—Five acres of Webb's Swede, open to the county of York. First prize, £10 10s., Mr. W. Scorer, Skelton, Ripon, 42 tons 11cwt 1qr 20lb per acre; second prize, £5 5s., Sir I. Lowthian Bell, Bart., East Rounton, Northallerton, 38 tons 15cwt 2qr 24lb per acre.

Three acres of Webb's Mangold. Prize, £5 5s., Mr. Fred Thompson, Marton Farm, Marton, R.S.O., 46 tons 4cwt 1qr 4lb per acre.

DISTRICT 6.—Five acres of Webb's Swede, open to the counties of Norfolk, Suffolk, and Cambridge. Prize, £10 10s., Mr. Thomas Kidner, Halvergate Hall, Norwich, 30 tons 1cwt 2qr 20lb per acre.

Five acres of Webb's Mangold. Prize, £5 5s., S. Nightingale, Esq., Scraby Hall, Great Yarmouth, 38 tons 12cwt 3qr 12lb per acre.

DISTRICT 7.—Five acres of Webb's Swede, open to the counties of Bedford, Cornwall, Cumberland, Cheshire, Derby, Devon, Dorset, Durham, Essex, Herts, Huntingdon, Kent, Lancaster, Lincoln, Middlesex, Northumberland, Notts, Northampton, Rutland, Somerset, Westmoreland, Cardigan, Carnarvon, Denbigh, Flint, Merioneth, and Radnor. First prize, £15 15s., Mr. William Morris, Crugan, Pwllheli, 51 tons per acre; second prize, £5 5s., Mr. J. Griffith, Bryn, Carnarvon, 45 tons per acre.

DISTRICT 8.—Five acres of Webb's Swede, open to the counties of Roxburgh, Haddington, Berwick, Edinburgh, and Linlithgow. Prize, £10 10s., Mr. John Meikle, Groughfoot, Linlithgow, 32 tons 14cwt 1qr 4lb per acre.

DISTRICT 9.—Five acres of Webb's Swede, open to the county of Perth. First prize, £10 10s., Mr. Jas McGregor, East Pilmore, Longforgan, 33 tons 14cwt 1qr 4lb per acre; second prize, £5 5s., Mr. Geo. R. Sharp, Bardrill, Blackford, Perth, 32 tons 10cwt 1qr 20lb per acre.

DISTRICT 10.—Five acres of Webb's Swede, open to the counties of Forfar, Fife, and Kinross. Prize, £10 10s., Mr. Thomas Walker, Easter Balgarvie, Cupar, Fife, 34 tons 10cwt per acre.

DISTRICT 11.—Five acres of Webb's Swede, open to the counties of Aberdeen, Banff, Kincardine, Inverness, and Elgin. Prize, £10 10s., Mr. Jas. Scott, Earnhill, Forres, 33 tons 15cwt 2qr 20lb per acre.

DISTRICT 12.—Five acres of Webb's Swede, open to the counties of Dumfries, Kirkcudbright, and Wigtown. Prize, £10 10s., equal, Mr. James Guthrie, Corwar, Outon, Wigtownshire, Messrs. W. and G. Lindsay, West Roucan, Dumfries, 32 tons 11cwt 1qr 20lb per acre.

DISTRICT 13.—Five acres of Webb's Swede, open to the counties of Stirling, Dumbarton, and Clackmannan. Prize, £5 5s, Mr. Alex. Lucas, Craigton Farm, Causewayhead, Stirling, 30 tons 2cwt 3qr 12lb per acre.

DISTRICT 14.—Five acres of Webb's Swede, open to the county of Ayr. Prize, £10 10s., Mr. Jas. Bone, Robstone, Girvan, 48 tons 8cwt 2qr 8lb per acre.

DISTRICT 15.—Five acres of Webb's Swedes, open to the county of Peebles. Prize, £5 5s., Mr. Chas. A. Gracie, Easter Happlew, Stobo, 25 tons 11cwt 1qr 20lb per acre.

DISTRICT 16.—Five acres of Webb's Yellow Turnips, open to the county of Lanark. Prize, £5 5s., Mr. Geo. Findlater, Jerviswood Mains, Lanark, 40 tons 18cwt 2qr 8lb per acre.

## Journal of Horticulture.

THURSDAY, DECEMBER 4 1902.

### Fleeting Honours.

NOVELTY is a great factor in the horticulture of these days. If the supply of new varieties of flowers, fruits, and vegetables were stopped, in all probability the several committees of the Royal Horticultural Society would cease to exist, for the simple reason that there would be nothing for them to do. Without novelties the horticultural press would be in danger of running short of matter and material for illustration, while the gardening world at large would have nothing to go in ecstasies over, nothing to wrangle about, and the whole thing would fall flat and uneventful.

Doubtless the main object of those who are responsible for the introduction of new varieties of plants is to make money. This does not necessarily imply greed, for it is all a part of the great work of advancement; and it is questionable whether many who have been the means of introducing beautiful and useful plants to the world have been recompensed to the extent they deserve. At the same time there is an acute business desire to get novelties Hall-marked by First Class Certificates and Awards of Merit, and the giving or withholding of these honours makes all the difference to the subsequent value of the novelties in question. If a man has got what he considers to be a good and new thing, he despatches it by natural instinct to a meeting of the R.H.S., and his object is not so much fame for himself as money for his pocket. A committee sits in judgment over the novelty, and on their decision its fate depends. If an award is granted, that novelty is possessed at once of certain value; it is talked about, written about, illustrated, and put into commerce; in short, it becomes famous in some degree; but if the committee

READERS are requested to send notices of Gardening Appointments or Notes of Horticultural Interest, intimations of Meetings, Queries, and all Articles for Publication, officially to "THE EDITOR," at 12, Mitre Court Chambers, Fleet Street, London, E.C., and to no other person and to no other address.

pass it over the owner can take it home again and enjoy its beauty or its usefulness alone, for the public will have none of it. Novelty is not its name then, and it recedes into the shades of insignificance because it has been found wanting by the authority that is not infallible. Considering the value, then, of a First Class Certificate or an Award of Merit, it is not surprising that there should be a mutual desire, particularly amongst tradesmen, to get for their novelties the hall-mark of value.

But how fleeting are these honours in many cases! How short-lived the fame of the subjects that win them! What becomes of all the new varieties of plants, fruits, and flowers that receive awards from time to time? The question is an interesting one, and the answer not easy to give.

When one thinks of the subjects that have been placed before the Royal Horticultural Society's committees say, during the past ten years, and have passed through the doors of the Drill Hall with First Class Certificate or Award of Merit tacked to their names, why the number must be legion, and if all, with their newly-acquired honours, went forth to conquer, what a wealth of material there would be in the world! As it is, there is a wealth, everyone will admit that, but the percentage of novelties that live and last and increase is small compared to those that make a flash in the pan, and go under, to be heard of no more. It is all part of the play, however. If we were content to keep and grow only the things we have, there would be no room for novelties, and what I want to dwell on most is the short career, yea! and ignoble end of many varieties of plants that bear the hall-mark of the Royal Horticultural Society, or some other special society.

Take Chrysanthemums, for instance, which just now are occupying chief attention. Last year a number of novelties were introduced. The best of them will be generally seen on show-boards this season, next year they will be represented in lesser numbers, and a few years hence their places will be entirely taken by the novelties introduced in the interval. This is just the way things go; but one pauses sometimes to wonder what has become of all the Chrysanthemums of the past. The fact is, people want novelties, and after the novelty stage is over the varieties die out, wear out, or are lost in the crowd. At any rate, a new Chrysanthemum is not much for a grower to pin his faith to. The raiser had better make the most of it while it is new, for it quickly grows old and is packed away with the hundreds of varieties whose glory has departed. After all, it is a hollow success that of new Chrysanthemums, and those who welcome their advent with applause also see them drop out of the ranks without a regret.

Like most other people who have a fancy for Dahlias, I have been much interested in the large number of new varieties that have been introduced this season, some of them quite distinct and others differing but little from forms already in cultivation. They have made their entry, these Dahlia novelties of 1902, they have been described, illustrated, and their merits discussed, and all that now remains is for the Dahlia-fancying public to buy them. The honours, however, that have fallen upon them are only fleeting. For a few seasons they may figure in collections and on show-boards, and then they will fall to the level of the commonplace or be lost altogether. Like stars in the theatrical world, our new Dahlias and Chrysanthemums have their day, either long or short as the case may be, and while it is on other novelties are being raised, which in due course oust the one-time favourites from their place. It will, perhaps, be said that novelties wear out, and after being in cultivation for a time they lose their characteristics. Such being the case, it would seem essential that hybridists and raisers should relax none of their efforts; but if this wearing-out theory be correct, then it is obvious that the continued high breeding, if I may so call it, is carried on at the expense of the constitution of the plant. But people will have novelty. They will rave about a new Dahlia and grow it in preference to such a gem as Glare of the Garden, for instance, though it may not be half so useful; but then, you see, one is old and the other is new.

The introduction of new Melons is not such a common occurrence as it used to be; and for the reason, I think, that growers have little faith in them. Recently the Royal Horticultural Society's Fruit Committee granted an award to one, but how long will it last, I wonder. Where are all the Melons certificated from time to time by the Royal Horticultural Society? A few remain in general cultivation, but the majority have gone under long enough since. Many a grower has gone out of his way to secure a highly-puffed novelty, only to be disappointed, and he has been glad enough to fall back on the old Hero of Lockinge, or some other standard and well-tried sort. New Melons are wonderfully deceptive, and the Award of Merit or First Class Certificate is no guarantee of their lasting powers and quality in the future. I think those who are responsible for the crosses are now alive to this, as there is not so much eagerness to put every seedling that comes into commerce, as there was a few years ago.

I have only just touched on the fringe of a question that affects almost every family of plants, but I have said enough to show that though the honours meted out to novelties are of a fleeting character, yet the demand for new things grows, and the supply must be equal to it if the interest in horticultural matters is to be maintained.—G. H. H.

## STRAWBERRIES IN POTS.

All plants for early forcing should be in frames. They cannot have too much air, therefore tilt the lights in mild wet weather, and remove them altogether when it is fair and warm, keeping close only when frost prevails. Do not place them in Peach houses or other structures where they will be exposed to drying currents of air. Evaporation in such is constant and excessive, wasting the energy of the plants, and not unfrequently so dries the soil at the sides of the pots, they not being plunged, as to destroy the active feeders. Drought is the greatest bane of the Strawberries; those in frames must have water as required, always keeping the soil moderately moist. Plants for midseason and late forcing are just as well stood on ashes and plunged over the rims in that material, or cocoa refuse, the situation being sheltered, but not shaded.

**EARLY FORCING.**—Plants of such varieties as La Grosse Suerée, Royal Sovereign, and Vicomtesse Hericart de Thury, must be held in readiness for starting at the beginning of December, where early fruit is required. There is no question that a Strawberry house is more suitable, especially when fitted with stage shelves, so that the plants will be about 1ft from the glass, that is, the tops of the pots, as the wants of the plants can be furnished according to their advantageous requirements, which is not always the case when the plants have to be forced in vineries or Peach houses; but they are grown successfully in such structures, and the fruits are always appreciated, the chief point being not to bring them on too rapidly. An early Peach house takes a good number, and is particularly suited to such varieties as Noble, President, and Auguste Nicaise, as they do not bear as much heat in the early stages of forcing as those before named.

In the case of plants having well developed crowns and abundant roots, there is nothing to fear as regards a satisfactory issue; but plants not in that condition should be started later, or be brought on very gradually. That, however, is not applicable to places where the ripe fruit must be had at a given time. Where this is the case, and the plants are in a backward condition, their starting satisfactorily may be enhanced by making up a bed of leaves 2ft to 2½ft in height, placing the plants in a frame upon it, bringing up the plants so as to be just clear of the glass, packing the spaces between the pots with damp leaves. The bottom heat at the base of the pots must not exceed 65deg to 70deg, the top being kept cool, air being freely admitted, 50deg of top heat not being exceeded, and when mild withdraw the lights.

Activity at the roots of the plants by means of the warmth is promoted, and the crowns will plump, the trusses being advanced considerably in embryo.

After three weeks or a month of this treatment the pots may be withdrawn, raising them gradually so as to insure the plants bearing the temperature of the Strawberry house or other structure without check. If taken direct from the bed the roots at the sides of the pots would in all probability get chilled; therefore they must not be taken from the warm bed to the shelves. Very careful treatment is required to secure a satisfactory return from very early forced plants.—G. A.

**Odontoglossum grande.**

The illustration represents a very compact specimen of *Odontoglossum grande* with nine blooms of more than ordinary size and rich markings, upwards of 6in across. The owner—Mr. G. H. Thompson, Grove House, Walsall, is an ardent amateur Orchid grower, and has exhibited the specimen in question on more than one occasion at the Birmingham Gardeners' Mutual Improvement Association's meetings, and was awarded a certificate of merit. In the culture of his collection of Orchids, he commences with small young plants, and finds more pleasure and interest in so doing than in procuring established plants. The collection, which consists of cool or intermediate species chiefly, are grown in two comparatively small structures—span-roofed—and efficiently heated from the large boiler attached to the adjacent electro-plate works. The enthusiastic and energetic owner devotes what time he can spare from his onerous business duties in attending to the Orchids. Mr. Thompson is a believer in leaf mould, especially for the culture of certain Orchids when they require a fillip in the young state; also in a judicious admixture of leaf mould, peat, and sphagnum for general purposes. The collection favourably impressed me, an impression shared by more than one expert in Orchid culture, and Mr. Thompson's ability and success is accentuated by the fact that the plants are existing under otherwise unfavourable conditions when it is considered that the site is closely surrounded by at least half-a-dozen factory chimneys belonging to other firms.

At the period of the writer's visit but few plants were in flower. It should be mentioned that several specimens of *Dendrobium Wardianum* were noted for their vigorous and well ripened pseudo-bulbs; likewise luxurious and fine plants of *Cymbidium Lowianum* in particular—a special favourite with the owner—and the photograph of a medium-sized plant of which bearing five or six long racemes of well-developed flowers, lies upon my desk as if courting re-inspection of its charming *contourage*. In concluding these remarks, mention may be briefly made of the remaining plants which are chiefly under the management of Mr. Thompson's son during his spare time from the works, and who is also an expert photographer. There were noted thriving batches of such as *Begonias*, *Cyclamens*, *Primulas*, and subjects too numerous to mention. Orchids and greenhouse plants, however, do not altogether enjoy a monopoly at Grove House if the well furnished and cropped vegetable and fruit gardens are taken into consideration—a feature being the luxuriant beds of finely curled Parsley, self-sown amongst the Gooseberry bushes, thus evidencing the capability of the natural soil to produce such an indispensable culinary commodity.—W. G.

**Cypripedium insigne.**

Perhaps these few notes on a well known but most useful Orchid, the Lady's Slipper, may prove of benefit to some of your readers, as I am aware that this variety does not always flower in a satisfactory manner. When I took charge of the glass department in my present place there were, among other plants, some two dozen plants of *C. insigne* in 8in pots, which, judging from appearances, had not been repotted for five or six years; notwithstanding this there was an abundance of good blooms. In the spring of the present year I decided to divide and repot them, using a compost of two parts peat, one of fibrous loam, and one of leaf soil from Oak leaves, sphagnum moss and coarse silver sand. Six and seven-inch pots were used, which were half

filled with crocks and the Fern rhizomes from the peat. A layer of sphagnum moss was laid over the crocks, the plants were then placed in the pots, and the compost added, being made moderately firm with the hands.

After potting they were placed in their former position, the north side of an intermediate house, and have been given plenty of ventilation ever since by the top and side ventilators. No water was given after the first watering in till the plants had rooted well into the new compost, but overhead sprayings were given morning and afternoon.

The two dozen old plants were split up into six dozen, most of which are now in flower, and have had a total of 250 good sized blooms, half of which have already been cut for house decoration. I am sending a few of the blooms to you by post, and hope they will prove acceptable. A FOREMAN.

[The good-sized blooms were much admired, and betokened correct treatment.]

**The Week's Cultural Notes.**

The beautiful *Odontoglossum grande* is now in full flower, and making a fine show. Very often the spikes are immensely large in comparison with the size of the bulbs, and consequently take away a good deal of the nourishment that should go to swell up the latter. Now, as the pseudo-bulb is finishing at the same time the flowers are developing, it stands to reason that the longer the plant has to maintain those lovely flowers the less

nourishment there will be left for the bulb, and the weaker in consequence the young growths will be in spring.

It is better, then, to remove the spikes, after say a fortnight's flowering, than to keep them on longer. They will still last a good time in water, and the plants will be benefited by their removal. I have mentioned *O. grande* as an instance, but there are, of course, many others to which the same remarks will apply. The grand many-flowered spikes of *Oncidium tigrinum* that fill the house with fragrance now, the showy *On. varicosum*, and many others may be noted. It seems a shame to cut them, but one has to look forward to another season as well as this.

The present is a bad time for the *Masdevallias*, these showy and beautiful little Orchids sadly missing the light that is so bountifully supplied them in their habitats. Keep them on the dry side and as close to the glass as possible. Remember, too, that a thorough cleaning, now that they are comparatively at rest, will lessen the quantity of thrips and other insects that prey upon them when in flower in spring. Fumigate the house lightly on two successive evenings before commencing to sponge the plants, and probably fewer of the blossoms will be disfigured by the white footpaths made by thrips.

Some varieties of *Cœlogyne cristata* keep much more plump in winter than others, the round bulbed varieties as a rule not shrivelling as much as the long bulbed ones. I have never found any great harm accrue to the plants from shrivelling, but it is better to keep them from it if possible. Give water occasionally on bright days, but pour it on carefully, and not about the brown dusky looking flower spikes, for although these are pointed and hard looking, and apparently well able to take care of themselves, there is always a danger of damping at this dull time.—H. R. R.

**Odontoglossum grande.****A Topsy-turvey Year.**

Despite alarmist paragraphs in the newspapers reporting hard weather, the following facts are still coming in. The station-master of Nassington, Lincs. (Mr. Randall), had a Victoria Plum tree bearing fifty fruits on November 19. St. Joseph Strawberries were gathered near Stamford, also on November 19. At Towcester, Northampton, a correspondent picked and ate a fine dish of green Peas on the 20th inst., also four Peach fruits grown in the open air. In his garden an Apple tree is in full bloom, and several others have bunches of flowers. Bunches of wild flowers and Strawberries were gathered on the 16th ult. at Beaford, North Devon.

### Brussels Sprout, Solidity.

I am posting you a small box of B.S. Solidity, which was sent out last year by an enterprising local firm of seedsmen, Messrs. Alexander and Brown, Perth. I consider it is by far and away the best Sprout I have grown, and send these few to be tested by the Editorial palate, and I have not the least doubt but that you will find them A1. The plants are sturdy, 2½ ft in height, and literally crowded with sprouts. The enclosed were just picked at random.—ALBYN, Bridge of Earn, Perthshire.

### The Horticultural Hall.

Allow me to express my surprise at the plan and elevation selected for the new hall. In an undertaking of national importance the very best design that can be obtained should be secured, and I venture to suggest that an open competition for architects would lead to that result. I offer no criticism upon the drawings referred to, but am convinced that better designs, both for the interior arrangement and the exterior effect, would follow if competitive plans were prepared by expert architects, and might suggest that a prize, or prizes, should be awarded to the successful exhibitors.—JAMES L. WOOD.

### Illegal Showing.

There is more or less rottenness in the whole state of horticultural Denmark—north, south, east, and west, I believe; that is, if seeing is believing, and if Mr. W. R. Raillem, or anybody else, "living down south" doubts it, it merely shows that they have not been privileged to peep behind the scenes. He, at least, has not, apparently, by the very pertinent manner in which he points out to "A Yorkshire Grower" (on page 490) his duty in the matter; but "A Yorkshire Grower" is probably a Yorkshire gardener, and what gardener, may I ask, would dare bring such a hornets' nest about his ears as any stir he made in the matter would inevitably do? I venture to assure Mr. Raillem on behalf of others besides "A Yorkshire Grower," and myself, that there is not the slightest doubt about our duty in the matter; but men who have their livings to get and have to live in "Denmark" find discretion the better part of valour. This matter has cropped up before in the *Journal of Horticulture*, as it has cropped up now, and will crop up again, but, *cui bono*? The most a gardener can do who knows all about it (and is there one who has been exhibiting for thirty years in the capacity of a gentleman's gardener, or the gardener's assistant, who does not know?)—the most he can do prudently is to do as "A Yorkshire Grower" has done, viz., keep well in the background, and cautiously stir up the nest of malignant practices with a long pen, covering his head the meanwhile under the bushel of a *nom de plume*. This gives an honest exhibitor some little relief for his outraged feelings in the buzz that arises. More he cannot expect, nor more will he get until the executive of societies takes more stringent measures to protect him, and stop winking at such practices themselves. This advisedly, for when a journeyman in "Stonewallshire" most of the Asparagus shown in the collections of vegetables was grown by one great market grower, who indirectly supplied it, not openly, of course, nor yet so secretly but what the secretary of the "Royal Stonewallshire Society" knew; unless, indeed, he was one of "the innocents abroad," and I don't think he was, neither is.—QUIZ.

I congratulate "Yorkshire Grower" on his pluck in bringing this important subject to the front. It is sad to think educated and polished men in the gardening profession stoop to such degradation. I call it by no less an ugly name than thieving; depriving an honest exhibitor of his rights. I am aware that I am making a serious accusation against a large body of men, whom, for my part, I should like to be able to respect. Silence only encourages them, and the only way to touch some of them is to prick their conscience through the medium of the press. At local shows this roguery is performed to an alarming extent, and unless the committees are more keen in investigating cases brought before them, and having their schedules drawn up so that the members have power to inspect any garden after entries are in and previous to the show, I am afraid a great many small exhibitions will soon be a thing of the past. I endorse what

"Yorkshire Grower" says about men collecting fruits and vegetables here, there, and everywhere, and I believe the remedy is for the staunch or honest exhibitors and committeemen to keep the subject to the front at their meetings; and to expose all proved cases as much as possible, and permanently disqualify any person from exhibiting. Now, a word to those who assist in this dishonest practice, either by giving, lending, or selling expressly for the purpose, and then sharing the prize money or not, are, in my opinion, as bad as the person who exhibits them.—G. G. H.

I am afraid the evil to which "Yorkshire Grower" calls attention is more difficult to cure than "W. R. Raillem" appears to think. I have occasionally known instances where the committee of a society were energetic enough to take action on information received and withhold prizes which were fraudulently won, but such a thing involves a great deal of trouble, especially when the exhibitor hails from a distance; and many people, it is to be feared, shrink from the task. Again, I have known a lady who, on reading that her gardener won a prize for a collection of fruit in which Figs were included, wrote to the secretary informing him that she had no Figs in her garden, with the result that the said gardener lost his prize, and as he was insolent about the matter, he also lost his situation. On the other hand, I have myself been an unwilling contributor to fraud. Most expert cultivators of Grapes can recognise their own fruit wherever they may see it, and I have on more than one occasion seen fruit at an exhibition which I had previously sold to a tradesman. But my evidence in such a case would not be sufficient to convict. Once I had a very clear case and made up my mind I was sure of revenge. A neighbour in the trade who was a regular customer for flowers, Tomatoes, &c., wanted two bunches of Grapes. I remembered that a show was to be held the next day some distance away, and I was to be a judge. I therefore cut the Grapes close to the bunches without leaving any stem, thinking that if evil intentions were aimed at I should frustrate them. But in this I was completely baffled. When judging time came I found these very Grapes in a collection of fruit arranged neatly in a basket, and I had no alternative but assist in awarding them the first prize. The next thing was to see the secretary and acquaint him with the facts, telling him that I was willing to take all responsibility if the committee would do their part. But my offer was not accepted, and the fraudulent winner received his prize.

Two or three exhibitors at the Bristol Show were in the habit of carrying away prizes for produce year after year which had not been grown by them. The show committee, which is composed principally of practical gardeners, inserted a clause in the schedule reserving to themselves the right to refuse entries from any person without giving reason for such refusal, and in this way they have shut out suspected fraudulent exhibitors. I know of one rather amusing case relating to illegal showing. A had entered at the Crystal Palace to show Asters. B had also entered in the same class. A had his flowers arranged at home when B, who was a near neighbour, called to see him. Says B: "I am short of that particular colour, you might give me a bloom or two." A in a weak moment yielded; with the result that he was placed second, and B was first. A told me of the incident, expecting sympathy, but I said, "Served you right."—WM. TAYLOR.

### A Mild Season.

I here send you a few Peas. I have been gathering every week up to November 17, and I have sent you a piece of the stem, or haulm, and a few Runner Beans, with a piece or two of the foliage. I also enclose a few flowers gathered from outdoors in the open on November 17 and 18. Dahlias I have had in abundance—that is, flowers. We have had a change here now, however, which will cut everything off. I have sent you a few Strawberries; they are green, if the weather had but kept open and fine I should have soon had them ripe. I have only finished putting my bedding plants up to-day, November 18.—JOHNSON MAYHEW, The Gardens, Woodbank, Stockport, Lanes.

Enclosed please find two spikes of Raspberries, cut this morning, November 19.—R. BURRELL, Westley Hall, Bury St. Edmunds, Suffolk.

### Gloriosa superba.

I am sending you a few flowers of *Gloriosa superba* as grown here, thinking they may prove interesting at this late date. For some few seasons we have pursued a practice of starting a quantity of this plant late, and we have been rewarded with a truly glorious display at a time when they are very useful, i.e., end of September till nearly Christmas. I think it of note

as we usually see it at its best during the summer, and, I am bound to add, sometimes at its worst, owing to the prevalence of thrips. With this treatment it grows as strongly and as freely flowers, while I think the colour, if anything, is enhanced. It is greatly appreciated here; we frequently use it for table decoration, the flowers lasting a long time when cut and placed in water. This is not an attempt to alienate your love for the Autumn Queen or to usurp any of its space in your pages, but perhaps, like us, you can find room for both.—E. J. P. [The flowers were exceptionally fine.—Ed.]

### N.C.S. Judges.

In fairness to the management of this society, I, as one of the independent judges at the late November Show, wish to inform the public, and "F. W." in particular, how we were ciceroned while in the building preparatory to commencing our duties on the morning of the show. A week before the date I received a letter asking me upon entering the building to go direct to a room in the gallery and wait there until I was required. I entered the building at 10.45, carrying out my instructions to the letter, and I can answer for eight of the other judges doing the same thing; perhaps there were more, one or two are not personally known to me, therefore I cannot be quite accurate beyond the number given. Whether or not "F. W." had other reasons to complain of, it should certainly be widely known how the management acted in this detail. I suggested previous to the day that we poor mortals should be blindfolded and escorted into the building and past those exhibits which we were to adjudicate upon later in the day!—EDWIN MOLYNEUX.

### The Scarcity of Journeyman Gardeners.

The question that should be at present engaging the serious attention of gentlemen, nurserymen, and head gardeners is the scarcity of young journeymen. Of practical qualified head gardeners there are abundance, but I maintain that the supply for young men as practical and efficient gardeners is very much exceeded by the demand. As we all know, an advertisement in the paper will bring dozens of replies, but sift them out, and how many young men will you find to take the under gardener's position who have any knowledge at all of horticultural work? A gardener of my acquaintance recently advertised for a journeyman. It is true the salary was not munificent, but the following are a good sample of the replies he received, and will serve to bear out my remarks. One letter went on to explain that the applicant was a carpenter and painter, but he had an allotment piece under cultivation, and he had been so successful with it that he was sure he would be a first-rate gardener, and would not object to fill in time at any odd jobs at his trade. Another had been working as a groom, but having noticed that coachmen and gardeners were advertised under the same heading, was confident that he could manage the work.

Of course, my observations do not apply to the kitchen gardener, but to the all-round gardener, who has to spend a lifetime at his work, and then can ever be learning and finding out something new in the cultivation of plants, fruits, and vegetables.

The pertinent question, however, is: Why is there such a scarcity of young gardeners? One reason is that the amount paid them is not as a rule sufficient, and when the young man has to face life on his own initiative he finds that other trades and professions offer him special inducements, but in the gardening world there are none. He wants to become a practical gardener, but what are his chances? Going right away from home, he is very likely installed in a bothy; he does not live, but manages to exist somehow, with absolutely no comfort whatever. If there is no bothy, then there are lodgings, which swallows up three-fourths of his salary. No wonder he hesitates; and so it is that, although the man has a natural liking for one of the most beautiful and interesting professions, the inducements offered other ways by far out-balance those offered by gardeners.

On the other hand, supposing a man decides to go in for horticulture. He starts at a low salary, living a life of discomfort, but taking an active interest in his work, and studying in spare time. Having, after a number of years' hard work, obtained a thorough knowledge of his profession, he desires to get a situation as head gardener. Are there any obstacles in his path? Merely the fact that dozens of able and experienced men are working as under-hands in a nursery, waiting for their long-coming chance. When it does come, is the salary as a rule good, and likely to repay the man for his years of hard study and labour? Emphatically I say no! More than likely it is just above the amount paid to the unskilled labourer.

There is no doubt whatever that the welfare and training of the coming generation of gardeners demands expert consideration, and something should be done to bring forward a combined movement on the part of nurserymen and gardeners to consider what in a few years threatens to become a serious problem.

Although horticulture has flourished in this country of recent years to a surprising degree, the credit is chiefly due to the large nurserymen and growers. I do not mean for one moment to cast any reflection upon gentlemen's gardeners, because the majority are skilled and capable men. My point is, that the gentlemen do not encourage their gardeners to test their skill; on the contrary, they prefer quantity to quality. On the other hand, the nurseryman is always striving to outdo a competitor, and therein lies the secret of his success. I am afraid the coming generation of gardeners will not enjoy the palmy days of their predecessors. The good old county gentry are fast dying out, and the self-made commercial man is taking their place. He has no eye for beauty or love for horticulture. Imbued with the modern theory money makes money, he wants to see the garden paying its expenses; if it does not, then it's bad for the poor head gardener, and worse for his struggling, half-paid journeyman. My view of the situation may seem gloomy, but it has been upheld by a number of horticultural experts whom I have consulted. Perhaps some of your readers will like to express an opinion on the subject.—E. E. R.

### CHERRY HOUSE.

Attend to the pruning of the trees; this is a light affair where the trees have been regularly stopped during growth and are full grown. Shoots not wanted for extension or filling vacant space should be cut back to about an inch from the base of the current year's growth, and the worn-out spurs, as well as the dead, may be removed. The terminal shoots, in the case of young trees not full sized, must not be shortened unless the extremity of the trellis is reached, and the central shoots of young trees will require to be cut back as may be necessary to originate shoots for filling up the space regularly, care being always taken to prune to a wood-bud. Fan-training is the most eligible system, particularly suited to the Cherry, as it admits of replacing any branch that may fall a prey to gumming. The house should have a thorough cleaning, the trees being dressed with an insecticide after washing with softsoapy water. A composition formed of a solution of softsoap, 4oz to half a gallon of water, one quart of tobacco juice diluted with a similar quantity of hot water, with slaked lime and flowers of sulphur in equal parts sufficient to form a thin paint, is an excellent dressing for Cherry trees, applying with a brush, being careful not to injure the buds. The roof lights need not be put on until the time arrives for starting the trees, which may be with the new year to have Cherries ripe in April and May.

### FIELD AND GARDEN-GROWN TURNIPS.

It is a fact commonly acknowledged that Turnips grown quickly in the open field are invariably more tender in flesh and of better flavour than those produced under conditions afforded in the garden. This has especial reference to the late summer and autumn. In the field the farmer treats Turnips strictly as a catch crop; it may fill in a space of time, or provide an auxiliary crop for the winter. In the garden when the weather is droughty, and the Turnip flea is ever ready to devour the tiny seedling as it emerges from the soil, there is often a deal of anxiety raised as to future provision. The garden, always stocked with vegetables of the Brassica species, affords a cover for the troublesome fly; but in the field this is not the case generally, though in some seasons the farmer need to anticipate these troubles.

Apart from these seed-bed anxieties, there is in autumn a much better textured root obtained from the open field, because their growth advance under so much better conditions: air, light, and freedom from obstruction, such as fruit trees afford, give them an unfettered opportunity. The method of tillage, too, differs from the garden; and, treated as a catch crop, there is an absolute change of soil, which to almost everything we grow is so important. This season, with its frequent showers, Turnips have done much better than usual; and the winter prospects, instead of being a dread, are a source of hope. A dearth of Turnips is sure to give rise to friction in the kitchen, and the gardener's life assume a worried tone if this important root vegetable is unavailable for its daily purpose.

Despite the frequent rains and lower range of summer temperatures, there has still been times of scarcity in Turnip crops; but the greater consolation comes in having a good store for the winter. When these fail in August seed-beds from the effects of summer drought and war-like attitude of the Turnip flea, there is a very dull hope for recurring months. It is in such times when the field gives a reserve to draw upon that is both welcome and satisfying—satisfying because of their good quality, and welcome because of the abundant store to draw upon. No crop repay open-air treatment more than Turnips, and no ordinary garden afford the same conditions as do the field for a winter's supply.—R. A.

## NOTES

## NOTICES

**The Chrysanthemum Analysis.**

The voting papers for the Chrysanthemum analysis are now in the hands of the leading exhibitors and growers, and Mr. E. Molyneux hopes soon to be able to have this annual contribution to the pages of the Journal completed.

**The Greenhouse at Kew.**

To the list of plants in flower, given on page 495 last week, we have now to add the following:—*Centropogon Lucyanus*, with crimson, corymbose heads; *Jasminum grandiflorum*, *Luculia gratissima*, *Rhodochiton volubile*, *Tibouchina macrantha*, Roman Hyacinths, Paper-white Narcissus, and a few *Hippeastrums*.

**Beckenham Horticulturists.**

On Friday, November 21, Mr. M. E. Mills, The Gardens, Coombe House, Croydon, gave a lengthy discourse on the culture of the Japanese Chrysanthemums (cut blooms) for exhibition. Mr. Wm. Weeks, late secretary Bromley C.S., presiding. The essayist being a very successful cultivator, it was exceedingly gratifying to him to face such a large audience, and if one could judge by the notebooks and pencils in evidence, information of a special nature was expected, and proved to be forthcoming. Mr. Mills minutely detailed his own practice from the cutting, leading his hearers through the various operations, mixing of soils, successional pottings, &c., and gave a long list of up-to-date varieties, with proper times of stopping to secure best results. For dealing with the dreaded rust Mr. Mills strongly recommended Bentley's Mildew Specific, he having found it very effectual. Many questions were put to Mr. Mills, and replied to satisfactorily by him. Mr. W. Taylor, of Forest Hill, also gave his ideas on stopping, and concluded by moving a hearty vote of thanks to Mr. Mills for his excellent essay. Mr. Weeks, in supporting this, made some very pithy remarks on Chrysanthemum culture in general, and his experience of the rust, if one can call it so, for, strange to say, Mr. Weeks has grown cuttings from stocks as badly infected as possible to be, but has never had the disease develop on his plants. Hearty thanks were accorded Mr. Weeks for kindly presiding. The society's certificate of merit was gained by Messrs. Langford and Robertson for exhibits of cut blooms with long stems.—T. C.

**Fruit Growers in Conference.**

This journal has at all times advocated co-operation amongst fruit-growers in order that the fruit-growing industry might become a thoroughly successful one in this country. On another page this week we print a letter from the secretary of the Fruit Growers' Federation, the consideration of which we commend to our readers. Local associations are springing up in the wake of the Federation, and will be attached to it. Last Saturday evening (November 30), at Swanley, in Kent, a meeting was held, and after discussion about twenty growers, including local market gardeners, expressed their desire to join the National Fruit Growers' Federation, and some few paid their subscriptions. The chairman, Mr. A. T. Matthews, secretary to the Federation, briefly thanked those present for their kindly expressions towards himself, and hoped the twenty joining the Federation would soon become 100.

Mr. John Wood presided over the second meeting, which was held after Mr. A. T. Matthews had left, for the consideration of the question as to the advisability of forming a growers' protection committee or association for North-West Kent, or Swanley and district. Mr. Thomas May ultimately moved the following proposition: "That a local branch of the National Fruit Growers, Market Gardeners, and Horticulturists' Federation be formed, to be called 'The West Kent Fruit and Market Gardeners' Association,' the objects being the consideration and protection of local interests; that regular meetings be held; that the officers be representative of all classes of the industry; that each member pay 10s. to the National Federation of Fruit Growers, and that the local branch be affiliated with the Federation." Mr. F. Wood seconded, and the proposition was carried unanimously.

**Appointment.**

Mr. Charles S. Ritchie, late of The Larches, Pembury, Kent, has been appointed head gardener to B. Oakes, Esq., Benellen Towers, Bournemouth, Hants.

**Vine Cross Fertilization.**

A correspondent writes: "I shall also be very much obliged if you could advise me as to the latest practical works on the subject of 'Vine Culture,' more especially with a view to cross-fertilisation." Can any reader assist?

**Devon and Exeter Gardeners.**

A well-written paper on "Hardy and half-hardy annuals for the flower garden," prepared by Mr. J. Mayne, gardener to the Hon. Mark Rolle, of Bicton, was read at a meeting of the Devon and Exeter Gardeners' Association at the Guildhall, Exeter, on November 26. There was a good attendance.

**National Dahlia Society.**

The annual general meeting of the above society will be held, by kind permission of the Horticultural Club, in the Club Room at the Hotel Windsor, Victoria Street, S.W., on Tuesday, December 16, at 3 p.m. Business: Report of committee for 1902, financial statement, election of officers, and other business.—J. F. HUDSON, Hon. Sec.

**East Liverpool Chrysanthemum Show.**

This society has been formed principally for the benefit of a large number of allotment holders, principally workmen employed by the London and North-Western Railway Company. To make the show more attractive outside exhibitors were allowed to compete, and a really smart little exhibition was the result. Mr. J. D. MacGregor, in the presence of a good company, performed the opening ceremony, and made a very encouraging speech. In the greenhouse competition there was much good work to be seen, the winners being Mr. Carnforth, Mr. Glenning, Mrs. Lillie, and Mr. Wolfe. The open classes all went to Mrs. MacGregor, as did the basket class, Messrs. C. C. Hall and Glenning following. With such a good inaugural show the committee may confidently look forward to a great increase next season.—R. P. R.

**Camphill Gardens, Glasgow.**

I think it is pretty generally known that the estate and gardens of this name have been in recent years acquired, as additional "lungs" for the City of Glasgow, by the Corporation. In addition to the expense which this acquisition necessarily involved, the Parks Committee built a magnificent winter garden for the welfare of the citizens. These hothouses are situated almost on the very summit of the hill, which rises a very considerable height above the surroundings, and which, as the name denotes, probably served to make efficient duty as "camp" for ancient Briton, Roman, and Roundhead in turn. It evidently has not escaped the notice of the strategist in civil broils either, for within the range of a stone's throw stands an imposing monument to the last efforts of the fated Mary to regain her crown and kingdom. Langside, or Battlefield, is in its immediate proximity. As would be expected, from a position so commanding, the prospect in every direction is delightful. Away westwards and northwards lies outstretched in the sinuous valley of the Clyde, the great north-western metropolis—indeed, the Second City. The woodlands, rising grounds, and far-away hills of the landward prospects are also not the least interesting and beautiful. Camphill adjoins the Queen's Park of Paxton fame, and taken altogether, a more desirable health and pleasure resort containing so many inspiring features, could not well be attached to any city in Britain. The winter gardens are a first class plant growing establishment. Almost every plant of sterling interest, from the beautiful Orchid to the gorgeous Chrysanthemum, is grown, and grown well. Mr. MacIvor is, without the colour of derogating from the merits of others, one of the ablest all-round gardeners that we know, and Mr. Whitton's selection for this important post was a judicious one. It will not therefore be a matter of astonishment to learn that the consensus of press and public opinion credit Mr. MacIvor this year with the honour of having at present a display of Chrysanthemums on view which for all round merit are unrivalled in Scotland. This says very much for Chrysanthemum culture in Scotland, especially in the locality of Glasgow.—D. C.

**Temple House Gardens, Great Marlow, Bucks.**

The rainfall here during the month of November, 1902, was 2.15in; there were six foggy mornings and three foggy days, and rain fell on fourteen days. The maximum temperature was 55deg on the 11th and the minimum 24deg on the 20th. The maximum for November, 1901, was 55deg on the 11th, and the minimum 17deg on the 16th. The rainfall for November, 1901, was 0.43in. We are situated close to the banks of the river Thames, and 105ft 9in above mean sea level.—G. G.

**Scottish Horticultural Association.**

The usual monthly meeting of this association was held on Tuesday, December 2, in 5, St. Andrew Square, Mr. Comfort, president, in the chair. A number of new members were proposed, and six new life members were elected. Mr. Todd, Edinburgh, gave a lecture on "Bouquets, and How to Make Them." He gave a very lucid and interesting address on the growth and development of bouquet making in recent times, showing to the young gardeners present the modern methods of bouquet making, and urged them to pay more attention to this subject than they usually give. He exhibited a very beautiful bouquet of Safrano Roses, as an example of present-day bouquet making. An interesting discussion took place, and on the motion of Mr. McHattie, a very warm expression of thanks was accorded to Mr. Todd. At the meeting a statement was made as to the financial results of the recent Chrysanthemum show. The report was a very favourable one, showing a credit balance of over £90. It was intimated that next year's Chrysanthemum show would take place on November 19, 20, and 21, 1903. Exhibits on the table were not numerous, but attractive. Mr. Chaplin, gardener, St. Leonards, exhibited a very beautiful plant of Begonia Turnford Hall. This was greatly admired. A plant, beautifully bloomed, of *Salvia splendens*, was exhibited by Mr. Fraser, Kilaroch. Mr. Todd exhibited a very handsome vase of *Souvenir d'une Petite Amie* Chrysanthemum, handsome blooms for decorative purposes. Mr. Todd also exhibited a very beautiful basket of Roses, cut from the open air. They were mostly *Général Jacqueminot*, *Caroline Testout*, and *Captain Hayward*. This exhibit was remarkable as an illustration of the mild late autumn which we have enjoyed. Mr. Kidd exhibited fine trusses of *Linulia gratissima*. A vote of thanks to the president brought the meeting to a close.

**London Dahlia Union.**

At a general meeting of the supporters of the London Dahlia Union held at the Royal Aquarium, Westminster, on November 4, a balance sheet was submitted and approved, and cordial thanks passed to the chairman and secretary. Mr. John Green was unanimously re-elected chairman, and Mr. Richard Dean secretary and superintendent for the year 1903. The chairman reported that a satisfactory agreement had been signed by the secretary of the London Dahlia Union on the one hand, and the secretary of the London Exhibitions, Limited, Earl's Court, on the other, for the exhibition of the Union in the coming year to take place at Earl's Court in the spacious Prince's Hall, close to the entrance to the Exhibition from Earl's Court Station; it is to be continued over two days, and close on the second day at the same hour as the Exhibition does, viz., eleven o'clock at night. Passes for exhibitors will be provided, and the sum of £20 given to the prize list; in addition, all the requisite staging will be provided by the company. This announcement was received with great satisfaction, and the action of the chairman and secretary cordially endorsed. A subscription list was at once opened, and a number of subscriptions have been announced. The date of the exhibition for 1903 was fixed for Tuesday and Wednesday, September 16 and 17. The schedule of prizes will be revised and extended. At the Aquarium show in September last the competition was keen; the entries in the nineteen classes (137 in number) averaged seven in each class. An unusually large number of seedling Dahlias were submitted for certificates, and the committee of leading growers who made the awards to new varieties exercised the most commendable caution in making awards only to such as were of undoubted first class character. Raisers show their confidence in the London Dahlia Union by sending in novelties in such large numbers; and they are dealt with in a manner calculated to command the confidence of Dahlia raisers generally.

**Violet Classes at Flower Shows.**

The efforts of Messrs. Isaac House and Son, the pioneers of Violet-crossing and culture in this country, in taking collections of these humbly beautiful flowers to many shows throughout the country, are having their reward, for already many horticultural societies are adding classes for Violets as a feature of their schedules. We might also refer to classes for Shirley Poppies, too, which are being provided at least by some societies in Surrey.

**Royal Meteorological Society.**

The first meeting of this Society for the present session was held on Wednesday evening, the 19th ultimo, at the Institution of Civil Engineers, Mr. W. H. Dines, M.A., President, in the chair. Mr. F. Campbell Bayard read a paper on "English Climatology, 1881-1900," which was a discussion of the climatological data printed in the "Meteorological Record" from the forty stations of the Royal Meteorological Society, which have been continuous for the whole of the twenty years. The elements dealt with by the author are: (1) temperature at 9 a.m.; (2) mean minimum temperature; (3) mean maximum temperature; (4) relative humidity; (5) amount of cloud; (6) rainfall; and (7) number of rainy days. The results form a valuable contribution to the climatology of the British Isles. A paper by Mr. C. V. Bellamy, M.Inst.C.E., on "The Rainfall of Dominica," was also read. This was in continuation of a former paper on the subject, and dealt with all the available rainfall data for the Island of Dominica. From this it appears that the mean annual rainfall of the island is 110in. In the neighbouring Island of Montserrat a remarkably heavy rainfall occurred during the night of November 28-29, 1896, when as much as 20.13in fell in the space of six or eight hours.

**An Ascent of La Soufriere, St. Vincent.**

Mr. J. P. Quinton and Mr. E. W. Foster, of the Botanic Stations of Sierra Leone and Lagos, on the West Coast of Africa, and both old Kewites, having returned to England about two months ago for rest and to recuperate their health, were sent by Sir W. Thistleton-Dyer, Director of the Royal Gardens, Kew, on a trip to the West Indies, that they might compare the work of the stations there with that of their own in Africa. The following cutting from the "Sentry" of October 31, published in Kingstown, St. Vincent, has been sent to us by Mr. Quinton, and relates to a daring visit made to La Soufriere there, lately so active:

"Favoured by fair weather, Mr. H. Powell, the Curator of the Botanical Station of St. Vincent, and Messrs. J. P. Quinton and E. W. Foster, of the Botanic Stations of Sierra Leone and Lagos respectively, made an ascent of the Soufriere on the leeward side on Tuesday morning, October 28, and spent an hour and a half on the summit of the mountain. In view of the fact that the crater has been daily emitting large volumes of steam, sometimes accompanied by ashes, since the eruption of October 15 and 16, this ascent is considered a daring feat, and Mr. Quinton stood on the west rim at a point that enabled him to advise them how far they could proceed, whilst Mr. Foster and Mr. Powell went down into the crater at a distance of about 120yds, as far as they could reach having regard to their immediate safety, and from that point, after which the walls assume a precipitous form, they saw right down to the bottom, where the apparently muddy water was boiling furiously. The journey from the sea shore at Wallibou to the first ridge leading to the Soufriere is exceedingly difficult, several new cliffs and ravines having been formed there; but afterwards, except for the still more narrow knife ridges than after previous eruptions, the road is easier. Arriving on the summit, after the toilsome journey of two hours and a half, the visitors found the old crater active, discharging volumes of steam and throwing up numerous cones of ashes to a height of 30ft or 40ft from a fissure close under the southern wall. The crater has assumed more of a funnel shape, being deepest in the centre. The ejecta is heaped up round the inner walls to a height of several hundred feet, and is almost red hot and smoking profusely. From a fissure in the rock, within 4yds from where the visitors stood, jets of steam were issuing; and from about this same spot on the following morning vapour and ashes were seen to escape in large volumes. The configuration of the mountain is very much altered."

### Pergolas and Roses for Them.

The following notes are from an essay by Miss Jekyll, V.M.H., which appears in the Royal Horticultural Society's Journal, vol. xxvii., part 1:

"It is only of comparatively late years that we have borrowed the pergola from the gardens of Italy. The simplest form of pergola in Italy is made of stout poles guiding and supporting the trunks of the vines, connected across the path by others of less diameter, with a roofing of any long rods laid lengthways along the top. This is repaired from time to time by putting in fresh uprights or other portions in the careless, happy-go-lucky way that characterises the methods of domestic and rural economy of the Italian peasant or small proprietor. Often in Italy one sees solid piers of rubble masonry coarsely plastered, either round or square in plan, or even marble columns from ancient buildings. These have a more solid wooden beam connecting them in pairs across the path, and stouter stuff running along the length. For our English gardens we have the choice of various materials for the main structure. If the pergola is to be near enough to the house to be in any sort of designed relation to it, and especially if the house be of some importance, the piers should be of the same material as the house walls—brick or stone, as the case may be. Fourteen-inch brick piers laid in cement are excellent and easily made. Such piers may be said to last for ever, and if it is desirable that they should not be red, or whatever may be the normal colour of the brick used, it is easy to colour them in limewash to suit any near building. For association with refined brick building bricks are sometimes moulded on purpose of thinner shape, either square or half-round in plan, the latter being for piers that are to show as round columns. Brick, stone or marble, or wooden columns are also used in refined designs. For more ordinary work the piers may be of Oak trunks of a diameter of 8 in. to 10 in. These, if tarred or charred at the butts high enough up to show a charred space of a foot above the ground-line, and put into the ground like gate-posts, will last from fifteen to eighteen years, or have about the lifetime of an ordinary field gate-post. A better and more enduring way is to have the posts of Oak 8 in. square, set on squared stones that stand a foot out of the ground, with a stout iron dowel let into the foot of the post and the top of the stone. Unless the appearance of the Oak post is desired, there is little, if anything, to choose in point of cost between this and the solid brick pier, as the Oak has to be squared and the plinth shaped and bedded on a concrete foundation.

"Whatever may be the kind of post or pier, it is important to have them connected by good beams. The beam ties the opposite pairs of posts or piers together across the path. In the case of brick or stone piers it should be of Oak or Larch 7 in. to 8 in. square, not quite horizontal, but slightly rising in the middle. This is of some importance, as it satisfies the eye with the feeling of strong structure, and is actually of structural utility. It is, of course, possible to make a pergola of iron with very flat arches, and supporting rods and wires or wire netting for the top; but it is the material least recommended, and the one that is the least sympathetic to the plants; indeed, in many cases contact with the cold iron is actually harmful.

"A modification of the continuous pergola is in many cases as good as, or even better than, the more complete kind. This is the series of posts and beams without any connection in the direction of the length of the path, making a succession of flowering arches; either standing quite clear or only connected by garlands swinging from one pair of piers to the next along the sides of the path, and perhaps light horizontal rails also running lengthwise from pier to pier. This is the best arrangement for Roses, as they have plenty of air and light, and can be more conveniently trained as pillars and arches, while the most free-growing of the Ayrshires and hybrid multiflora ramblers willingly make swinging garlands. Roses are not so good for the complete pergola.

"For the open pergola without top, Roses are among the best of plants: on one post a pillar Rose and on the other a Rambler. A select list for this use would be: as pillars, *Alister Stella Gray*, nankin yellow; *Reine Marie Henriette*, red; *Climbing Aimée Vibert*, white; *Carmine Pillar* and *Waltham Climber*, No. 1, reds; and for ramblers, the *Garland*, *Dundee Rambler*, *Bennett's Seedling*, and *Madame Alfred Carrière*, all white or flesh white; *Crimson Rambler*, *Reine Olga de Wurtemberg*, *Longworth Rambler*, and *Dawson*, reds; as well as multiflora single and double, the large-flowered multiflora, and *R. Brunoni*. To keep the bases of the piers clothed, some strong young shoots of the current year should be shortened so as best to cover the space, when, instead of making the whole length

they would otherwise have attained, they will stop growing at the tips and throw their strength into preparation for flowering shoots at the lower levels."

#### National Rose Society.

The annual dinner, with Mr. E. Mawley in the chair, will take place on December 11, at 5.30 p.m., after the annual general meeting in the Hotel Windsor. In the business to be brought before the general meeting there is a proposed addition to Regulation 13, as follows: "A Sub-Committee has been appointed to draw up a proposed addition to Regulation 13, which will give further directions as to the award of Gold Medals to new seedling Roses." A copy of the proposed addition to Regulation 13 will be distributed at the meeting, or can be had previously on application to the hon. secretary.

### THE OUTDOOR TOMATO CROP.

Outdoor Tomatoes have always been considered to be a crop which depends very much on the season for its success, or otherwise; but the series of ten, more or less dry years, during each of which it has been possible to grow this crop with some success, had gone far to remove this impression, and tempt growers to plant more and more. This season, however, again brings the fact very forcibly on our notice, and shows that it must always be a risky undertaking, for outside Tomatoes have been an almost universal failure. Even in sheltered gardens, where they have every chance, they have only done well in a comparatively few favoured spots; and in most places where field crops have been attempted scarcely any, and in some cases no fruit, has been ripened on the plants. The writer has seen one case in which a grower, encouraged by the success of a crop, one acre in extent, in the previous year, this year covered five acres with some 40,000 plants, which did not produce sufficient fruit to nearly pay the heavy expenses of producing, planting, and other attention, to which must be added a considerable expenditure on pots and stakes. In this case the planting-out was done under very promising conditions at the end of May and beginning of June, the soil being in excellent tilth, and several light showers following the operation to give the plants a good start. Growth was rapid, and fine large plants were quickly produced, and subsequently gave a very good show of bloom, so that thus far everything looked very hopeful; but when the time came for stopping the growth by nipping out the growing point, which usually takes place about the middle of August, when four trusses of bloom have been formed on most plants, it was evident that unless there should be an extraordinary change in the weather there could not be a great amount of fruit ripened, for very little had set; whereas at this time the lower trusses would, under normal conditions, consist of fruit already swelled to a considerable size.

Thus, a certain amount of disappointment was anticipated; but only on the score that the warm, sunny season would not extend far enough into the autumn to allow of any great quantity of fruit coming to perfection. Nothing was thought about disease, which now began to make its appearance; first attacking the leaves, then the fruit, and ultimately sweeping off the whole crop, with the exception of a few fruits here and there. The disease which attacked this crop, and many others as well, was the common Potato disease (*Phytophthora infestans*), which has been so very prevalent among Potatoes all over this country and part of the Continent this year, and which is well known to attack other species of *Solanum*, and particularly the Tomato. It first makes itself evident in brown blotches on the leaves.

These blotches soon spread over the entire surface of the leaf, causing it to curl up. At length the leaves and stem are turned black, and blotches appear on the fruit, even green fruit being affected when the disease is very bad, as it was this year. No doubt this could have been checked to a great extent if spraying had been resorted to when the disease first made its appearance, and thus the fruit saved and part of it ripened. Bordeaux mixture would have been the most efficient fungicide to use for this purpose; but it has the great disadvantage of spotting the fruit, so that, unless washed by rain, it would have to be wiped before being fit for market or the table.

It is, probably, not wise to save seed from infected Tomatoes or from fruit taken from infested plants, though it has not yet been proved whether this disease, and others, can be passed on in this way. This fact ought to be settled by experiment, for the case is not analogous to that of the Potato, with which the whole infected tuber is used for seed, and remains in the soil in contact with the newly-formed tubers, so that the disease has every chance of spreading. In the case of the Tomato only the fleshy part of the fruit is apparently affected, whilst the seeds are to all appearance clean, so that there is a chance that they may not carry disease spores, especially as they can easily be dressed so as to kill any spores adhering to the outside. However, it is not good policy to take seed from a weakened stock unless there is some particular reason for it, such as the maintenance of some special stock or variety.—B.

## Botanic Gardens.

(Concluded from page 468.)

The Oxford Botanical Gardens, like that at Cambridge, is the property of the University, founded in 1632 by Henry, Earl of Derby, who endowed it as a Physic Garden. It is the oldest institution of its kind in Great Britain and Ireland, occupies five acres of ground; for 400 years previously it was used as a Jew's burial ground. The old glass houses were replaced in 1893-4 by a range of five houses.

The gardens are open until six p.m.; the houses from two till four. The library, museum, and herbarium may be visited by permission of the Professor of Botany. Jacob Bobart, a German from Brunswick, was the first appointed curator, although John Tradescant is said to have been the first gardener here. Bobart was followed by his son, whose list of the plants cultivated in 1648 contains 1,600 species and varieties, nearly 600 of these being native plants. The Oxford garden, though the oldest, can hardly be said to have moved with the times; they still have only the five acres surrounded by a high wall. There has been a good deal of discussion about having a new site, as the present one cannot be extended. Some people are reluctant to part with old associations.

The Physic Garden, Chelsea, was founded 1673, at an annual rent of £5, for a term of sixty-one years. A wall was built round it in 1674, and the gateway is dated 1686, which is supposed to be the date when the collections of plants were arranged. In 1732 Sir Hans Sloane, a great traveller, bought some ground which included this garden, and he gave it to the Apothecaries' Company, conditionally that it was always kept as a Physic Garden.

Philip Miller was made curator. Another condition of the gift was that the society was to give fifty new plants each year to the Royal Society until they had given 2,000; this they continued until 1773, and gave in all 2,550 specimens. We cannot here go into all the ups and downs of this old historic garden.

In 1899 the garden was reconstructed, and a new curator, Mr. William Hales, of the Royal Gardens, Kew, was appointed. For many years previous to this the gardens had been going from bad to worse, as the Apothecaries' Society found it too expensive, and it would have fallen into the hands of the builder had not a hue and cry been set up against such a step being taken. The Charity Commissioners took action, promising to find money for its upkeep; a committee of management was appointed, and all that has since taken place is well known from the recent notices in the gardening papers. I have paid a recent visit to this old historic place, and am glad to say that Chelsea is again flourishing under its young and able curator. May it long continue so is my sincere wish.

The first physic garden in this country was that of Gerard, established at Holborn, in 1567. John Gerard was not only a physician, but also a practical gardener. His own garden, according to a catalogue published by himself, contained nearly 1,100 kinds; quite a large collection for those days. He was also for twenty years superintendent of Lord Burghley's garden. In Johnston's edition of Gerard's "Great Herbal" are mentioned 2,717 kinds of plants.

The new Botanical Gardens opened at New York contain 250 acres, large glass houses, and a very imposing and substantial building for the herbarium, and they are rapidly acquiring large collections for it and the gardens. This

promises to be a fine institution, and one worthy of the United States.

Most of our colonies have either botanic gardens or botanic stations, at which are grown and propagated in large quantities such plants as yield either food, medicine, material for clothing, or manufactures, and distributed to the planters (often gratis) for the development and prosperity of their respective countries. Altogether there are many such gardens, and the men who have charge of them are selected from Kew. It is impossible for me to treat more fully in this lecture on these colonial gardens, and the useful work which they do. Notes and illustrations are, however, often to be seen in the pages of the gardening papers.

Of British botanic gardens, those at Kew are not only by far the largest and most important in this country, but also in the world. Other botanic gardens in England are Birmingham, Bath, Liverpool, Regent's Park (London) belonging to the Royal Botanic Society, and another rather small one at Bury.

In Scotland, besides Edinburgh, there are the following: Glasgow, Aberdeen, and one at St. Andrew's University. The Glasgow garden is more devoted to the ornamental and decorative use of plants rather than the purely botanical arrangement of the collections. This is not to be wondered at now that it is managed by the Town Council. In Ireland we have one at Cork, Belfast, and Trinity College Gardens, Dublin, in addition to that already mentioned at Glasnevin. — ALBERT HOSKING.

Southampton Show: A general view of the Fruit Section.

## Killerton, Devon.

The notes furnished on pages 496 and 497 relating to the magnificent trees at Devon will be further emphasised by the addition of the short table which Mr. J. Coutts

has supplied, and which is given below. I had omitted to mention that graceful shrub *Nandina domestica*, with bushy sprays of its pinately cut leaflets and panicles of pretty white flowers, plants of which are in the grounds. *Trachycarpus* (*Chamaecarpus*) *excelsus* is well represented, and it is proposed to line both sides of a short open-air drive or avenue with these members of the Palmæ. *Lavender* was not to be found at Killerton two years ago, but the present gardener is nursing a goodly stock of it for prospective liberal plantings. He already has a broad border filled with it, through amongst which is planted the White Lily (*L. candidum*).

In a cosy corner between a garden wall and one end of a vinery there is a luxuriant *Eupatorium odoratum*, which has attained to woody growth towards the stock, and reaches over 7ft high. Its robust shoots were laden with the pale whitish flowers in the middle of November, and its glossy green leaves were very handsome. As a rule, this plant is grown in pots for the greenhouse. *Abelia rupestris* also called for notice by reason of its vigour; while *Clianthus puniceus*, the Glory Pea, is remarkably rampant on a doorway in the same corner, and flowers very freely. Growers northward will envy Mr. Coutts in having climate so mild and balmy. I have now done with the shrubs, and append the list referred to above:—

|                                 | Height. | Girth at 5ft. from             |
|---------------------------------|---------|--------------------------------|
|                                 | ft. in. | base.                          |
|                                 | ft. in. | ft. in.                        |
| <i>Sequoia gigantea</i> ..      | 85 0    | 13 6                           |
| <i>Sequoia sempervirens</i> ..  | 75 0    | 11 4                           |
| <i>Cryptomeria japonica</i> ..  | 70 0    | 6 6                            |
| <i>Fitzroya patagonica</i> ..   | 10 0    | 2 6                            |
| <i>Libocedrus decurrens</i> ..  | 65 0    | 5 6                            |
| <i>Cunninghamia sinensis</i> .. | 60 0    | 5 9                            |
| <i>Thuopsis dolabrata</i> ..    | 25 6    | This has no girth to speak of. |

In borders 1½ft broad, and specially prepared, Irises have been planted. These narrow borders run in line with and close

against a number of the glass houses. Such species as *Gatesi* and *susiana* of the Cushion Irises are already established in their comfortable quarters, and quite evidently happy. The handsome proportions of the flowers of the *Oncocyclus* group, and the beautiful veining in the segments, made them most valuable garden plants, though their culture demands considerable knowledge and care. The bulbous Iris, as *alata*, *reticulata* (and its varieties), *Bakeriana*, *Vartani*, and *orchioidea* were all found to be doing well, and growths were already prominent peering through the soil. Each species has a little cubicle to itself. Along with these Irises there are some brilliant species of *Tulipa*, and also the choicer varieties of *Daffodils*. The rarely grown *Iris japonica* is in pots under glass, but will be planted out very shortly.

At this season of the year the crimson-red *Ixia*-like flowers of *Schizostylis coccinea* are very generally prized for conservatory embellishment, but with fair winds and mild airs, at Killerton it is massively planted in the open. From one degenerated clump of this Iridaceous plant the offsets were secured, and were planted at equal distances apart and in lines in a sheltered border. The result is a gay crop of utilisable blossoms now, but a light wooden framework has been erected over the whole body of the bed, so that a tiffany screen may be rolled over in case of frost. *Iris stylosa* has been treated on the same lines, and the large bed is now yielding a supply of the beautiful flowers, and will continue on till March. *Iris Kämpferi* has been planted around a water fountain and pool in the centre of the kitchen garden.

The fruit trees having been neglected during latter years, the new gardener has begun a work of improvement. Old trees are in places giving place to new ones, and the best of the established trees are receiving treatment in accordance with their requirements. Brown Turkey Fig crops freely, and finishes its fruits on open sunny walls. Peaches, of course, are as common as Pears and Cherries, while Apples are cultivated in every form. Most of the trees are named. Amongst novelties, the Japanese Wineberry is somewhat liberally grown. The fruit walls are good on the whole. Some parts of them are plastered, and have a smooth surface, with wires for the trees. In the fruit room Mr. Coutts was able to show me some beautifully modelled fruit—large clean, and bright. He speaks highly of Roundway's *Magnum Bonum* Apple as a cropper at Killerton, and referred to Mr. George Bunyard's opinion of it, which in his firm's fruit catalogue I find expressed thus:—"Large; an old variety almost fallen out of culture, we have no hesitation in calling it the best dessert kind. It is melting in flesh, very aromatic and richly flavoured, brisk, and agreeable; fruitful on Paradise, and worthy of a place in the most select garden list. Much richer in flavour than Cox's Orange or Ribston, and only needs to be tasted to secure appreciation. Do not gather too early, and try on a wall, in cold soils. In tarts or baked it is a perfect sweetmeat. It is in use from November till February."

The brightly-coloured Devonshire Quarrenden crops well; and of Newton Wonder the opinion here is that it will take the place of *Dumelow's Seedling* (Wellington). *Bramley's Seedling* is very reliable; *Fearn's Pippin* is grown, and produces nice fruits; *Egremont Russet* is certainly one of the best, and has a rich flavour; *Belle de Pontoise*—a large Apple; also *Emperor Alexander*, of which some beautiful specimens were on view. *Wyken Pippin* was another of the favourites, and is a good old orchard variety well deserving of further attention. *Peasgood's Nonesuch* and *Cox's Orange Pippin* received the usual commendations. Of *Lady Henniker*, a December fruit good for dessert or cooking, some fine fruits were shown to me, and *Blenheim Orange* has a great reputation as a marketable variety. Having a large surplus stock of its fruits, Mr. Coutts sold one-and-a-half tons, and received at the rate of 8s. per cwt. for them. These were sold locally, with little incumbent expense, and at that price Apple culture, he says, would pay him. *Mère de Ménage*, as orchard trees, produces good saleable fruits. Amongst varieties of Pear I specially took note of his samples of *Verulam*, *Catillac*, *Vicar of Winkfield*, *Winter Nelis*, *Glou Moreeau*, *Duchesse d'Angoulême*, *Beurré Hardy*, *Eyewood*, and *Beurré Rance*.

Violets are successfully cultivated in frames, the usual popular sorts being seen in an abundantly floriferous condition. Border Carnations are somewhat largely grown, and hardy flowers in general receive great attention. Wall gardening, on a limited scale at least, will be another feature of Killerton as time advances. My visit to Sir Thomas Acland's beautiful estate will long be pleasantly remembered, being, as it was, a first visit to Devon, and made at a period of glorious autumn sunshine.—J. H. D.

#### The Difficulty of "Chrysanthemum."

During the hearing of a charge at Thorpe (Essex) Petty Sessions recently of damage to flowers the prosecutor stated that the defendants had smashed his greenhouse and pulled up his "Christian anthems." The magistrates' clerk, mildly: "Chrysanthemums," you mean. Prosecutor (firmly and with dignity): "Christian anthems," I said, sir.—"Daily Mail."

#### Mr. Godfrey's Collection at Exmouth.

The show season for Chrysanthemums is past, but the memory of the flowers is present. I was fortunate to be at Exeter three weeks ago, when exhibition Chrysanthemums were meeting the gaze at every turn, and from Exeter the train journey along the left bank of the estuary to Exmouth is but half-an-hour. Mr. W. J. Godfrey has given Exmouth a fame in the minds of Chrysanthemum growers from his export of novelties remarkable for their fine build, and the brightness of colour in most of them. On page 449 of the Journal for November 13, reference was made to the gems of 1901-02, and the subjoined notes convey my impressions of the latest comers, some of which are already exceedingly popular. Take for instance the lovely *Bessie Godfrey*, than which no unitary Chrysanthemum is prettier. The blending of palest straw or primrose on the edges and tips with the rich canary-yellow overlay in the middle part of the florets, endows the bloom with the greatest charm, and the elastic curve of the petals is another point of attraction. Everywhere during the closing season I have heard praises of *Bessie Godfrey*, and seen good flowers of it. Both late and early buds yield good blossoms.

*Mrs. D. V. West*, a white Australian seedling, retains its foliage better, and comes easier than *Madame Carnot*, and is in all respects a good variety. *Wilfred H. Godfrey* has flat reflexing florets, rich crimson on the surface, and gold reverse, and is one of the most promising of the novelties. The constitution is good. Loveliness was sent out last year, and has been seen in many places during this autumn. The flowers are massive, the petals very broad, not smooth, but lined, and the colour is a delicate canary-yellow. It is one of the very best exhibition flowers, and good for purely decorative uses, and large blooms seem to be easily obtained from the plants, they being decidedly pleasing to the eye.

*Colonel Weatherall*, a Japanese incurved, has a robust constitution, the plants at Exmouth having heavy green leaves and stout stems, and is of medium height. The broad petals are bronzy-orange, the centre of the flowers being bright yellow. *Wallace E. Vowden* bears good blooms, with abundance of incurving florets, but the colour seems rather dull. *Durban's Pride* is a Californian variety, one of the few good Americans that have succeeded here. It has something of the *Madame Carnot* or *Mrs. T. W. Pockett* stamp upon it, and as it is a pretty lilac-pink with a white centre, I shall look to seeing *Durban's Pride* largely grown by the end of next autumn.

*Duchess of Sutherland* has obtained a considerable reputation this year, and is one of the best up-to-date yellow exhibition flowers. At Exmouth, however, the plants were of rather straggling habit. *Nellie Stevens* throws massive blooms of a bronzy-buff colour, and is an attractive incurved var.; while *Mafeking Hero* is undoubtedly one of the best varieties for large flowers in existence. On page 448 of this Journal Mr. E. Molyneux says: "The blooms when fully developed measure 9 in in diameter, carrying a depth of quite 6 in, which is a good proportion. The colour is dull red, the reverse being gold. The tips freely turn upwards, giving added character to the flower." It has already won repute. *Kimberley*, now well known, is another producer of huge blooms, and is a reliable early yellow. In the same category comes *Calvat's F. S. Vallis*, of which splendid blooms have been exhibited this year by the champion whose name it bears. But *F. S. Vallis* has been shown by Mr. Godfrey much better than by the "champion." The latter admits that the Exmouth flowers were much superior. Mr. Godfrey had twelve flowers in his stand (as a centrepiece) at the Aquarium in November. It does not require "a lot of doing"; indeed, it is one of the easiest to do, and will become very popular from this fact. It is a decided beat on *G. J. Warren*. *Mrs. John Balfour* is a pretty pink seedling from *Madame Carnot*, with long reflexed petals, and is one of the Exmouth novelties for 1903. It was much admired at the Aquarium, where it was shown as a "seedling from *Madame Carnot*."

I would conclude these notes on the Chrysanthemums by noticing a few of the foremost purely decorative sorts. *Scarlet Prince* is of dwarf habit, with flowers that are quite scarlet in the height of the season. When Chrysanthemums are brightly coloured, they ARE; that is to say, the richness of their tones is intense, and we have had quite a goodly selection of fine things during the last three years. *Goacher's Crimson* comes

to mind; Horace Martin is another, Jessie Cottee a third, Etoile de Feu a fourth, and others are known. Scarlet Prince in November (late plants) was brick-red orange with gold tips. Brightness is one of Mr. Godfrey's latest seedlings, coming at its best in November. It is of the brightest crimson, with a gold centre. Happiness is a golden-orange with red basal florets, exceedingly floriferous, and a good late decorator. The Fairy I strongly recommend for the lighter forms of decorative work. It is a beautiful pink and white. Grace is one of the very largest single whites, and has long stems. It is one of the best for cutting. Exmouth Rival, the Japanese, furnishes an exceedingly good decorative flower, the colour being intensely rich. Golden Prince is one of the richest yellow Chrysanthemums in existence, and will prove the market yellow for December cutting; it is a novelty for 1903.

Mr. Godfrey may have some further startling additions to offer to Chrysanthemum growers another season; at any rate, his efforts are directed toward that end. In one of his span-roofed houses he had a regiment of plants from the flower heads of which the florets had been cut back with scissors, so as to expose the pistils and stamens. Overhead runs a horizontal hot-water pipe, with an inch bore, and to this the flower heads are suitably tied—the plants being raised, where necessary, to allow of this. A gentle heat is maintained through the pipe, so that the immediate atmosphere surrounding the fertilised flowers is always sufficiently warm and dry. Mr. Godfrey's seedlings are noted for their compact dwarf habit and the brilliance of their flowers.—VIATOR.

#### Selection of Japanese Varieties.

I can assure "O. L." that what little I write about new Chrysanthemums is a pleasure to me if the information given is of some service to beginners, especially if they reside in the country and have not the same opportunity that I have of inspecting the new varieties. In the last issue of the Journal, "O. L." will find three excellent white flowered varieties. Of the seven named by "O. L." but three—Mrs. J. C. Neville, Miss Mildred Ware, and General Hutton—are known to me. The last named has been repeatedly shown during the late season in capital condition. Miss Mildred Ware is quite new, and certainly should be added to every collection, no matter how small. To avoid an invidious selection from the three distributors quoted, I prefer to name nine distinct varieties from the selection given in the Journal. The reason for adopting such a method as I propose must be apparent to all, viz., Two firms do at times jointly distribute one variety. For instance, Miss Mildred Ware is being sent out by Messrs. Davis and Jones. How, under such circumstances, can the preference be given to one? The varieties are W. Duckham, rose pink; Mr. F. S. Vallis, soft yellow; Mr. S. Fryett, rose amaranth; Miss Elsie Fulton, white; Bessie Godfrey, rich yellow; Miss Mildred Ware, cerise, flushed with brick red; Madame Paolo Radaelli, pale pink, flushed rose; Lily Mountford, creamy white, flushed and striped rose; Mafeking Hero, red with golden reverse. The suggestion given by "O. L." regarding the analysis is not too late, and no doubt the electors who are now busy making their selection will bear in mind what is said by "O. L."—E. MOLYNEUX

#### Chrysanthemums at Belfast Show.

I have thought that some of your readers might like to hear a bit of Mums at the Belfast show, but I am not going to attempt a list of exhibitors. I saw there the finest flower of Mrs. T. A. Compton I ever remember, not that it is a graceful flower at any time, but this was a splendid flower of its kind, 9in across and fully 9in deep, and perfectly finished; not a bad petal. This was exhibited by C. E. A. Allen, Esq. (Mr. H. Jackson, gardener), Stormont Castle, but not in competition. I also saw in the first prize vases three splendid flowers of T. Humphreys. This I should say was the champion vase in the show, or at least it received most attention amongst exhibitors, especially as it was a novelty of last spring. The flowers were fully 7½in across and 6in deep, drooping gracefully, and showing the lovely deep chestnut colour. It was a truly glorified E. Molyneux. Single-flowered varieties are always a pretty feature at Belfast. I might mention other things about the show, but that is not my object. My object is to refer to a thing which struck me immensely on each day at the opening of the show. The first day there was a fashionable crowd of people outside the entrance, more than I ever saw outside a London theatre, awaiting the opening at twelve o'clock. Then there was a living stream entering for about an hour. Some of the officials estimated the attendance at nearly 5,000. The admittance was 2s. 6d., or by tickets (subscribers' or otherwise). I was thinking: What would lots of our societies over this side think of such an attendance at the opening? But then it was not an ordinary exhibition At all! At all!

The St. George's Market was prettily decorated and festooned, for the Lord Lieutenant and Lady Dudley were coming to open the show; it was indeed very kind of them. But they must

have felt gratified at the reception they had. The King himself could not have received a more hearty welcome. And the Ulster Horticultural Society's committee members must have felt, and did feel very gratified. One can only say it was a blessing after such a flooding as they had at their last show. Then the second day, about 10 a.m., there was another gathering of quite a different character. All the children from the Training Schools Union, deaf and dumb, &c., were invited, free, and were left to their own free will, to go as they pleased, and yet not a flower or fruit was touched. When they left each and every one was presented with a bag of buns and sweets and an Orange and Apple. I don't know who seemed the happier, the givers or the receivers, for the givers were in their element. It created and left a feeling of warm regard for the Ulster character in the heart of yours truly—W. WELLS.

#### Chrysanthemum S. T. Wright.

On page 492, "W. W." calls attention to Chrysanthemum S. T. Wright, and it would be interesting to know what height the growth of this Australian will attain. In the Exmouth Nursery I saw many of the latest Australian crimsons, including T. Humphreys, Mrs. C. J. Salter, and Henry Barnes, which were catalogued as growing 5½ft; but here they were nearer 10ft. The colour was very rich, but the flowers were much undersized. In the same house were a large number of plants of Exmouth Rival, not one of which exceeded 4ft in height, and the flowers were second to none in richness of colour, being also much the largest among rich crimsons I have yet seen. The flowers were not over-broad, but were very deep.—G. FOSTER.

#### New Incurveds.

New varieties possessing merit are but slowly added to this section, and to be an advance upon existing varieties further limits the addition. As a rule, the best varieties are obtained from "sports," but somehow these freaks are few and far between nowadays. Present day raised varieties too frequently show much Japanese blood in the florets, rendering them much too coarse to belong to a typical incurved bloom, which should be of the globe type, with closely, even incurving florets, quite smooth on the surface. Yearly some few deserving varieties are added. The following are the best of those that have come under my notice:—

MRS. JOHN SEWARD would be well described as a buff or cinnamon Topaze Orientale, as in build and petal it partakes of that variety quite closely.

SOUVENIR OF W. CLIBRAN is best described as a giant form of Nellie Threlfall, having the same kind of floret and colour.

WM. BIDDLE has long closely incurving florets, with a base of pale chestnut and a yellow centre.—E. M.

#### New Decorative Varieties.

Now that Chrysanthemums are so much more cultivated for home decoration than formerly, any addition to this section possessing merit are always welcome. The following are deserving of attention, all being November flowering varieties:—

HAPPINESS is one of Mr. Godfrey's raising, is exceptionally free flowering, in colour it is orange red at the base, with a yellow centre; very effective under any light.

BRILLIANT is from the same source, and, as its name implies, is exceptionally bright in colour. In growth it is sturdy, the flower stalks stiff as they should be in a decorative variety; belonging to the small flowered Japanese section.

GRACE is a single flowered variety, with extra long semi-drooping florets, and a clear yellow disc. The colour is the purest white; quite a gem for cutting.

MADAME C. NAGELMACKERS has narrow, semi-drooping petals of the purest white. The blossoms are quite full in the centre, not too large, and flowers abundantly. This promises to be one of the best of decorative Chrysanthemums, either as a plant or in a cut state.

MRS. E. ROBERTS is a seedling from that favourite single flowered variety Mary Anderson. The newcomer is a deep rose pink, very free flowering, with extra stout peduncles.

LOI FULLER.—This semi-drooping, narrow petalled variety reminds one of Belle Paule in colour, white edged with purple.

VERTE PORTIVINE is a small flowered Japanese variety, yellow shaded green, quite a novel and interesting variety.—E. M.

The Horticultural Hall. The "Journal's" Roof-plan No. 1.

## The Horticultural Hall.

Following up the remarks which we made last week regarding the ground plans of the three first floors of the Horticultural Hall, we again enter upon the subject. Since that time we judge by the letters which are reaching us that the criticisms we have ventured to pass upon this long desired temple of British Horticulture are by many not considered to err upon the side of severity. Indeed, like Lord Clive, we may well be astonished at our moderation. Having respect to the great difficulties the Council has had to encounter, and to the present modest dimensions of the building fund, we have suggested merely an inexpensive alteration in the design of the roof. But our correspondents attack the proposed plans in the same comprehensive spirit in which the Highlander passed criticism upon his gun, which ironically suggested its improvement into a completely new one. They would have entirely fresh designs.

If the centenary were not so near, and if more time remained for the augmentation of the subscription list and the elaboration of fresh plans proportioned to a larger building expenditure, such a policy might not be unwise. All these demands for a general reconsideration of the scheme, however, involve in the end a much greater cost, and this sum can only be secured by the usual methods adopted by enthusiastic churchwardens and speculative Australian sheep-farmers; to wit, a mortgage on the church or farm of a similar amount to the capital in hand.

If the Council is daring enough to reckon upon subscriptions

to the amount of £30,000 in eighteen months, and then to give a mortgage for another £30,000 pending the time when millionaire Fellows of trans-Atlantic extraction are as plentiful as stolen turkeys at a negro thanksgiving, the present plans might be postponed, or recast for a more pretentious programme. At the rate millionaires are appearing on the Western horizon, such a Napoleonic policy of tempting Providence might, after all, not find its termination in a Moscow, Leipsic, or Waterloo. The American "wakefulness" preached by the halfpenny newspapers consists, like Bonaparte's, of recklessly discounting the future, and it sometimes succeeds. If, therefore, the Council feels sufficient of this spirit of modern progress surging in its veins, some action should at once be taken to reconsider the matter of the hall *de novo*. If not, all efforts should be directed to temperately modifying the existing plans.

Every effort should be made to raise a structure which, if it cannot out-rival, will at least hold its own with the handsome residential blocks which are destined to rise around Vincent Square and everywhere in Westminster during the next thirty years. In support of our contention expressed last week, regarding the unsightliness of the slate roof, we this week publish two suggestive sketches of what could be done to give increased dignity to the building. They are the work of another Fellow, our artist Mr. Shayler, and are merely intended to show roughly how with a little patience and meditation the Building Committee, in conference with their architect, could effect alterations incomprehensible to ordinary minds, and of which we ourselves do not pretend to furnish more than a vague indication.

The Horticultural Hall. The "Journal's" Roof-plan No. 2.

## Pollen.

With very few exceptions, if we examine the flowers in our gardens, we shall find in their centres a number of slender projections, upon the tops of which there is a mass of powdery material, which is the pollen or fertilising element of the flower. Having found some of this, it would well repay the observer, if he or she has a microscope of even low power, to scatter a little of this powder over the field of view and study it. Treated thus we shall find that every different species of flower has a differently shaped pollen grain, and that one and all are beautifully fashioned, and often beautifully coloured, dispelling entirely the first idea of its being mere dust of no particular structure.

In point of fact, the pollen grain is one of the greatest

ence in the results it may produce. Although in itself neither a seed nor a spore, we have but to place a grain of it upon the stigma of the flower whence it was taken to see it presently apparently germinate seed fashion, for under such circumstances it will burst its husk and protrude a root-like tube, which will burrow into the stigma like a root into the soil, traverse it from end to end, and, finally, always carrying the little dot of matter aforesaid with it, combine with the embryo seed near the base of the stigma, and so fertilise and fit it for subsequent growth and development.

The stigma varies very much in length in various plants, and hence the pollen grain varies in size, because it needs a greater or less reserve of material to form a longer or shorter tube. Lily pollen, therefore, is large grained, and there are few more beautiful objects than the pollen of *Lilium candidum* or *auratum*, or any of the

The Horticultural Hall. The Council's Plan.

wonders of nature, for within its tiny compass there are enshrined all the potencies of the plant species from which it sprang. We may, however, if we are clever enough, magnify it enormously, and dissect it to the utmost, and yet find nothing but a little gummy matter contained in a sort of husk, and with perhaps a just perceptible dot or nucleus floating within it; and yet it is within that infinitesimal dot that, in some occult fashion, lie the future capabilities of a plant to produce exactly all the manifold characteristics of its parents, or, it may be, the combined characters of several progenitors; or, going even further, it may, in some mysterious way, adopt original plans of its own.

The pollen grains may vary as they will in shape and size and colour, and be gathered from plants as different from one another as the Oak and a tuft of grass, and yet in every case the vital principle within it will be found to be outwardly and inwardly identical—i.e., be a simple cell, despite its difference of origin and the consequent differ-

larger Lilies, it being more or less intensely coloured crimson or orange, beautifully long, oval shaped, and pitted all over with exquisite delicacy. Having grasped the wonderful vital complexity which must exist in the pollen grain to enable it to fulfil its task of transmitting specific or varietal characters both of form and constitution, we shall be the more astonished at Nature's lavish profusion in some cases in the supply of these tiny bodies.

Even in our ordinary garden flowers, which are fertilised by the bee or other insects, the pollen grains enormously outnumber the possible seeds, and every bee-keeper knows that the bee appropriates a very liberal percentage in return for the service rendered in carrying the balance from bloom to bloom, and thus involuntarily mating them. Many trees and other plants, in addition to the grasses, trust entirely to the wind to carry the pollen to the female flowers, which are frequently borne on other trees or smaller plants than those which bear the pollen flowers. In these cases, Nature, in order to secure the continuance

of the species, despite the enormous waste involved by such a mode of distribution, fashions a far greater quantity. At the right period the stroller through Pine forests may now and again see or be enveloped in what appear to be clouds of mist or smoke when a passing breeze shakes the foliage and liberates the pollen of the flowers associated with it. Countless millions—numbers, indeed, are mocked at in such connections—must miss their goal for every one which attains it, and yet in every one the race potencies are complete, despite the minuteness of the chance afforded them for development. The human workman who was employed to make, say, a million delicate machines, knowing that only one would ever be used, would, we fear, be tempted to scamp a good many, but Nature “scamps” nothing, and perfection is her maxim throughout.—CHAS. T. DRUERY, F.L.S., V.M.H.

## Flowers of the Bridal.

In almost every country that has had a more or less civilised population so far as history carries us back, flowers have been associated with the bridal ceremony and bridal attire. Flowers of many kinds, and of varied colour, but, what seems natural, white flowers took the first place amongst many nations, because emblematic of maiden purity and innocence. Possibly the reason why the spring or early summer was a favourite time for marriage with our ancestors in the past, that just at that period wild flowers were plentiful, garden ones being then little cultivated. There seems no ground for a modern idea that May is an unlucky month to choose for the event. Nor is there anything more than fancy that a shower of rain is unlucky at a wedding, else there might be a reason against selecting April.

During recent times two flowers are prominent as bridal flowers—the Orange blossom and the Lily of the Valley. They are in contrast to each other, one is the conspicuous flower of a tree; its companion, partly hidden by leaves, comes from a plant of lowly growth. We put the Orange flower first, as especially associated with the bridal veil. Few, perhaps, are those in wedding parties who have any idea of its significance, but that we might expect. Some think it may be linked to the famous golden Apple of the gardens of the Hesperides, and there are some who maintain the Orange is only a substitute for the Citron, its ally the tree to which old legends belong referring to marriage.

We cannot be sure, but the Orange blossom is said to have been worn by Saracen brides, as it was supposed to bring happiness and a large family, the latter possibly not desirable to most people now. Then, after the Crusades, European brides took to wearing it sometimes, though its general adoption is quite a modern practice. Of course it follows that the fruit is lucky too in some way, and Oranges should form an item amongst the refreshment after the ceremony. We may observe, even if it is a little irrelevant, that William, Prince of Orange, and the Orangemen take name not from the fruit but from the Orange Lily, chosen as symbol. The colour has been so objectionable to some party men that they have even boycotted Carrots! To the Lily of the Valley, as a bridal flower, we cannot give a date, nor point to the country where it was originally used—perhaps in France or Italy. It was not only a sign of purity, for the plant, growing amidst thorns, was an emblem of the Virgin Mary; but popular belief gave it also the power of bestowing happiness upon the wearer. Other Lilies, in far remote centuries, had the repute of being sacred, or bringers of good fortune; the ancient Jews, indeed, are supposed to have worn at weddings a white Lily—*Lilium candidum*.

Amongst the Greeks it was common for the priests to place upon the bride's head a wreath of Lilies twined with corn—a symbol of happiness or prosperity. Farther yet we glance into the past, and in the magnificence of Egypt—the oldest nation—we find the Lotus figuring at ceremonies of a joyful nature, which was evidently one of the Lily tribe. Wreaths of a blue Hyacinth (species doubtful) have been worn in some countries both by the bride and her attendant maids, emblematic, it is thought, of fidelity.

But, singular to say, the same flower was associated with the dead, because, according to the myth, it sprung from the blood of Hyacinthus. Hence the poet's words:—

And so we ring a change upon these bells,  
For now of death, and now of love it tells.

That much renowned plant the Rosemary, of small esteem now, comparatively, had, like the Hyacinth, an important position both at funerals and weddings. Its use, however, has been discontinued nearly two centuries. Formerly the Rosemary not only bedecked the bride, but sprigs of the plant were frequently given as a token of affection by lovers to each other. Occasionally the old error crops up in print that the plant was named after the Virgin Mary. Likely enough, as a species rich in virtues, it may have been one of the numerous plants presumed to be under her guardianship, but it certainly took its name from the marine cliffs, where it was found growing freely wild. At weddings it was usual to add to the Rosemary's fragrance by dipping sprigs of it in perfumed water. One of the Shakespearian characters refers to the plant as a token of “remembrance,” which would make it significant at a time when new ties were being formed, old ones might be forgotten. Roger Hacket, in a curious wedding sermon of 1607, introduces the Rosemary, and remarks to the couple: “Let this flower, ensign of your wisdom, love, and loyalty, be carried, not only in your hands, but in your heads and hearts.”

Myrtle, so highly esteemed amongst the ancients, that a crown of it seemed a fitting reward for victors in certain games, is still regarded as a lucky plant. This belief prevails in some parts of England and in other countries. Thus, a Somersetshire maiden may be observed carefully attending to a Myrtle on her window-sill, since she thinks that if the plant languishes, it will be a bad omen for herself. Further, the Myrtle is credited with the power of producing and preserving love, hence its appropriateness at a wedding. Besides, it is a symbol of fertility, though singular to say, it has associations with sorrow and war. Three leaves taken from a bridal wreath of Myrtle and eaten were supposed to cure fever in Russia. Again, the Laurel, or Bay (*Laurus nobilis*), was welcomed at a wedding. The Romans called it the “Plant of the Good Angel;” its presence warded off the visits of evil spirits, so they thought. An emblem, too, of unchangeableness, it might well have its significance to bridegroom and bride. It is noticeable that the Rose, though a flower much admired, and sacred to Venus and the Graces, does not appear prominently amongst wedding decorations of the past, but chaplets of Roses were probably sometimes worn, when they could be made. Both in the East and West, Jessamine, when in bloom, has had its elegant stems twisted into the bridal wreath.

The Hawthorn, Whitethorn, or Maybush is a wedding shrub. By the ancient Greeks it was placed in the bride's garland, and branches of it were arranged upon the altar. Remnants of this practice may be seen in Greece of the present day. It would have been more poetical, but less true to life, if the shrub had no thorns, yet it might show forth the fact that marriage could not be all happiness in the future. Germans sometimes sent wreaths of Holly as wedding presents, the plant being a sign of cheerfulness, though the prickles would seem to be portentous, like those of the Hawthorn. Rods of Hazel have been carried in wedding processions, and at the close of the day these were burnt, and the nuts, when attainable, formed part of the feast. Our wild flower, Meadow-sweet, or Queen of the Meadow, had another name—Bride's Feathers—not because it was used as a decoration, but from its resemblance to the plumes brides wore.—J. R. S. C.

### New Cannas for 1903.

The undernamed Cannas are being sent out next spring by Maison Croizy et Cie., d'Hyères. They are fully described in “L'Horticulteur Nouvelle,” November 13. Orchid-flowered varieties: *Senateur Viger* and *Frederick Benary*. Crozy's race: *Leon-Varroud-Vial*, *Madame H. Coufourier*, *Madame Paul Cazeneuve*, *Antoine Roozen*, *Madame Noël Blanche*, *Dr. Albert Florence*, *Mrs. J. Wood*, *Bizarre*, *Madame Julie Aubert jeune*, *Madame André Charmet*, *Souvenir de Madame Ferdinand Cayeux*, *Nathalie Bourseul*, *Lady Trevor Lawrence*, *Madame Anne Boucod*, *Adrien Lefebvre*, *H. Burnaert*, and *Madame L. Clausse*.

## Societies.

## R.H.S. Scientific Committee, November 18th.

Present: Dr. M. T. Masters (in the chair); Messrs. Douglas, Odell, Saunders, Bowles, Worsdell, Holmes, Veitch, Baker, Druery, Hooper, and Worsley; Drs. Rendle and Cooke; Prof. Boulger; Revs. W. Wilks and G. Henslow, Hon. Sec.

Dr. M. C. Cooke, V.M.H.—Dr. Masters rose to offer in the name of the committee their hearty congratulations and goodwill to Dr. M. C. Cooke on having been presented with the society's medal. Dr. Cooke in reply observed, in thanking the committee, that he had no anticipation of the honour, as it was quite unexpected, since whatever he had done was always *con amore*.

*Stenoglottis longifolia*.—Mr. Odell brought spikes of this S. African Orchid with fasciated stems. The flowers are very small, pale rose, and spotted with crimson. He observed that the method of cultivation was similar to that of *Disas* in a cool house. Mr. Henslow remarked that *D. grandiflora*, "The Glory of Table Mountain," does not seed freely there, but propagates itself by stolons underground.

*Lily, fasciated*.—Mr. H. Simpson, Wandsworth, sent a fine specimen of *Lilium auratum* in this condition.

*Acorns, striped*.—Rev. M. C. H. Bird, of Brunstead Rectory, Stalham, Norwich, sent specimens of acorns peculiar to one tree in the above locality, a variety of the common Oak; they are very small and transversely striped. *Q. nigra*, of U.S., has similar striping, but the cause is unknown.

*Ruellia Cleistogamous*.—Mr. H. C. Davidson, Great Totham, Witham, Essex, called attention to this hitherto unknown peculiarity. The *Ruellias* referred to should have borne "large, blue, Bignonia-like flowers"; but the flowers borne were white, and so small that they could hardly be seen unless they were looked for. The envelope was early pushed off, like that of *Eschscholtzia*, but the pods swelled and produced seeds. One of the plants carrying the tiny white flowers and also ripened seed-pods, has since produced a single blue flower.

*Fertility of hybrids*.—Mr. Ch. C. Hurst sent the following communication:—"In the report of the last meeting of the above committee in *Journal of Horticulture*, 1902, ii., page 330, under the heading 'Vigour in Hybrids,' the following statement is made:—'It was observed that hybrids of *Cypripedium Fairrianum* will not cross.' According to the records this statement can hardly be accurate, because on sixteen distinct occasions hybrids of *C. Fairrianum* have produced offspring which have duly flowered. The following is a list of the crosses recorded (for detailed references see the forthcoming 'Orchid Stud Book.'): (1) *Paphiopedilum* × *vexillarium*, a hybrid between *P. barbatum* and *P. Fairrianum*, has been successfully crossed with *P. barbatum*, *P. bellatulum*, *P. hirsutissimum*, *P. Spicerianum*, *P. insigne*, *P. Stonei*, *P. × calophyllum*, *P. × Io*, and *P. × Williamsianum*. (2) *P. × Arthurianum*, a hybrid between *P. insigne* and *P. Fairrianum*, has been successfully crossed with *P. Argus*, *P. Spicerianum*, and *P. × Leeannum*. (3) *P. × Niobe*, a hybrid between *P. Spicerianum* and *P. Fairrianum*, has been successfully crossed with *P. insigne*, *P. Spicerianum*, *P. × orphanum* and *P. × javanico-superbiens*. We may therefore conclude that whatever degree of fertility may be peculiar to hybrids of *P. Fairrianum*, it cannot be said that they are absolutely sterile." Mr. Veitch quite corroborated Mr. Hurst's observations.

*Introduction of fungus pests*.—Dr. Cooke made the following observations on this subject:—"Apropos of Mr. Geo. Massee's statement at a recent meeting of the Scientific Committee that a fungus pest, a smut on grasses (*Cintractia*), was introduced into Britain with a species of *Bromus* from Patagonia. A similar instance has come to hand as to the introduction of the destructive Apple and Pear scab (*Fusicladium dendriticum*) into South Australia. This disease was apparently wholly unknown in that colony previous to 1877, when its introduction was attributed to an infected Seekel Pear tree which was imported from America. This is not improbable, and should serve as a warning to destroy, without reserve, any and all imported plants which give evidence of disease, and thoroughly disinfecting the soil."

*Ferns proliferous*.—Mr. Druery exhibited a pinna of *Athyrium Filix-femina* var. *plumosum*, Druery, showing a profusion of young plants developed from dorsal—i.e., soral, bulbils, which first appear as fleshy excrecences among the sporangia, most of which abort. As a rule, the bulbils only develop into minute excrecences, in which it is extremely difficult to maintain vitality during the winter, owing to the almost immediately subsequent decay of the deciduous fronds; hence only few plants have been raised by this means. This year, however, due probably to the moist season, the bulbils appeared much earlier than usual, and developed fronds which appear in the specimen very clearly on the upper surface. This proliferous trait is inherited from the progenitor, the Axminster *plumosum*.

*Apple, pyriform*.—Mrs. Bayldon of Dawlish sent an Apple resembling a Pear, from a large old tree in an old cottage garden. A similar fruit was thought to be a hybrid between an Apple and a Pear, but such has never been obtained.

*Black Hamburgh failing*.—Abortive flowering shoots were sent by Mr. G. H. Ricketts of Cranemoor Lodge, Christchurch, Hants, who observes that "every year the branches promise fairly well, but the Grapes fall, being good for nothing." Failure in root-action, probably waterlogging, was the general opinion of the committee. Mr. S. T.

Wright of Chiswick Gardens, to whom they were submitted, reports that, in his opinion, the Vine is "Canon Hall Muscat, a notoriously bad setter, and only succeeds well as a bearer in a few places. I would suggest rooting it out or grafting with a more reliable variety. Black Hamburgh never shows branches in the form of the specimen sent."

*Potatoes with tuberous shoots*.—Mr. C. Osman, Sutton, showed samples of Potatoes which had sent out shoots each of which bore numerous small Potatoes. The peculiarity had been figured by Dr. Lindley about the middle of the last century, but it is not so common as super-tuberation or secondary tubers issuing from the main one. This has been common in certain places this year, apparently due to prolonged degree of warm weather, which causes the Potatoes to start into growth, but instead of forming leafy shoots produces tubers. The variety known as The Garden is said to be particularly liable to it.

*Plant dyes*.—Dr. Plowright sent the following communication together with specimens of the dyes described:—

"*The common Larkspur*.—*Delphinium consolida*, as the older botanists used to call it, is a plant of considerable interest. The generic name *Delphinium*, for instance, is taken from Delphis, a dolphin, the similitude being in the flower buds before they expand. One of the aberrant members of the *Ranunculaceae*, it was in the olden times admitted to a place in the English Flora on doubtful grounds. 'The expressed juice of the petals, with the addition of a little alum, makes a good blue ink,' Withering tells us in his 'Botanical Arrangement' (14th edition). The quantity of juice which can be expressed from the petals is very little; but when they are crushed with a small quantity of water, and alum added, a green liquid is obtained. That it is possible to write with this is evident from the sheet of writing now exhibited; but that it merits the designation of ink is another matter. The green colour is not due to chlorophyll. It is capable of retaining its colour for more than a year, as is evident from the specimen exhibited; in point of fact, the sentence written with the 1901 ink is rather darker than that written with the 1902 ink. But this green fluid possesses another character of considerable optical interest, it is fluorescent. When viewed by reflected light it is green, as is the case when daylight is transmitted, not only ordinary daylight, but even direct sunlight. When, however, an artificial light is viewed through it, the fluid appears a red; the electric light, gas light, or even the flame of a wax vesta match has the same effect. A solution of chlorophyll in alcohol is also fluorescent, but in the reverse way, being green by transmitted, and reddish by reflected light. (1) Indigo-red dissolved in alcohol. This specimen is prepared from wood after the manner described by Prof. M. W. Beyerick, of Delft: 'To an infusion of fresh wood leaves, isatin and hydrochloric acid are added and the mixture boiled.' It assumes a dark, almost black colour, which is due to the deposition of innumerable acicular crystals of indigo-red, which are readily observable under the microscope. These crystals are insoluble in water, so that if the fluid be filtered, they remain on the filter as a black powder; this may be dissolved by alcohol. (2) A red colouring matter soluble in water and in alcohol. Obtained by treating dry wood seed with hot water and hydrochloric acid. This specimen is an alcoholic solution. This colouring matter is turned green by alkalis, whereby differing from indigo-red. (3) An alcoholic solution of the red colouring matter contained in the flower heads of *Hypericum perforatum*. This has been known for a very long time. Linnaeus speaks of the Scandinavians colouring the spirituous liquors by it. It is turned bright green by alkalis. (4) The male catkins of the black Poplar crushed with water and hydrochloric acid. (5) Petals of *Geranium sylvaticum* crushed with alum and water. These last two (5 and 6) are probably the so-called erythrophyll. (6) Petals of *Centaurea cyanus* crushed with alum and water. This is said by the older botanists to yield a "blue ink;" but the mixture thus obtained can hardly be called blue, but rather a dirty chocolate. It has, however, a red fluorescence by transmitted light."

*Cladium Mariscus*.—Specimens were received from Dr. Plowright, who writes:—"These distorted leaves were found upon plants growing on Ashwick Fen during the past season. Many plants were similarly affected." They had evidently received some check during growth.

*Helenium autumnale virescent, &c.*—Mr. Worsdell showed specimens of this not uncommon malformation. The bracts of the involucre were enlarged and subfoliaceous, while the corollas were virescent; but in lieu of the pistils was a minute capitulum surrounded by several brown anthers devoid of pollen. The virescent corollas of the ray florets were very much enlarged and trumpet-shaped, as in *Centaureas*, but both ray and disc florets had minute capitula in place of the pistil.

*Crimson Oak leaves*.—Mr. Wilks showed leaves which came from a single tree of a bright crimson colour on both sides. It was remarkable that no other trees bore such leaves in the neighbourhood.

## National Chrysanthemum, December 2nd, 3rd, and 4th.

The last of the long series of flower shows held in the Royal Aquarium, London, has now been recorded; and this latest exhibition of the National Chrysanthemum Society was indeed conspicuously meritorious. The classes were all well filled, one

having as many as twelve entries, and others eight, nine, and ten. The trade exhibits, too, were very interesting. Mr. W. Howe of Streatham was foremost for a group of Chrysanthemums and miscellaneous plants; and Mr. R. Foster of Nunhead came second. For a collection of plants, flowering, berried, and foliage, Mr. Howe was again leader. Mr. C. Blick had the only entry of six flowering Begonias. For the half-dozen decorative bush grown plants, Mr. W. Yeatman of Bethune Road, Stamford Hill, was awarded the lead, and fine plants they were. No one, unfortunately, opposed his chance.

Three varieties out of a large number of novelties shown received F.C.C.'s. These were Gen. Hutton, now well-known, shown by N. Davis; Beauty of Leigh (Davis), raised and shown by C. Penford, Leigh Park Gardens, Havant, one of the noblest and best Japs we have seen. The colour is a much richer yellow than Bessie Godfrey—a deep, yet soft glowing yellow. The petals are broad and spoon-shaped at the tips, these curling right round. The flowers staged were fully 6½ in deep and 7 in broad, being well built up. It was spoken of highly everywhere. Lastly, there was the deep golden incurved Miss E. Seward, shown by Mr. W. Seward, The Firs, Hanwell.

For the twenty-four Japs in eighteen varieties Mr. R. Kenyon was clearly leader with a heavy collection of fresh blooms for so late in the year. His best were Madame R. Cadbury, J. R. Upton, Charles Longley, Bessie Godfrey, and Guy Hamilton. The second place fell to Mr. H. Weeks, The Gardens, Thrumpton Hall, Derby, with flowers of very good colour. G. J. Warren was superb, Madame P. Radaelli (very pale) and Ethel Fitzroy were the best. Third out of ten came Mr. G. J. Hunt of Ashstead Park, Epsom, having a massive and deep bloom of Bessie Godfrey.

Again Mr. Kenyon led for the dozen distinct Japanese, and his manner of staging the flowers high up seems to us commendable, displaying the blooms to the best advantage. Madame Von Andre, very pale; Nellie Pockett, glossy white and strong; and Mrs. E. Thirkell, were worthy of special note. Mr. G. J. Hunt was a capital seconder, and third, Mr. H. Weeks of Thrumpton Hall, out of twelve entrants.

Class 5, for twelve incurved blooms, again found Mr. Higgs as the foremost contributor of these, and his flowers were equal to any at the November show. He staged a massive and beautiful bloom of Frank Hammond, and other good flowers were Ma Perfection, Bonnie Dundee (golden), Ialene, and Madame Lucie Faure. The competition was good, there being twelve sets. Second came Mr. G. J. Hunt, with rather rougher flowers than those of Mr. Higgs. His Bonnie Dundee was quite a ruddy hue, of good form. Mr. F. J. Clark, Wistow Hall, Leicester, was third.

The sixth class, for twenty-four trebles in vases, filled a large amount of space, and presented a very pleasing feature. Mr. R. C. Pulling, Monkham's Nurseries, Woodford Green, led off, and his Frank Hannaford particularly was splendid. The succeeding prize fell to Mr. G. J. Hunt, a strong competitor on this occasion. The third place was awarded to Mr. C. Payne, Sandhills, Betchworth, Surrey. The class filled three sides of a square round the west end fountain, there being six entrants. The first prize was £2.

Mr. R. C. Pulling was placed first for twelve bunches of Japs in six vars., these being exhibition sized flowers. Mr. H. Perkins of Greenlands made a very close second, and Mr. W. Howe, Park Hill, Streatham, third. Mr. W. Hammond of Woodside, Maidenhead, was foremost in class 8 for six bunches of Japanese varieties, and Mr. J. Sandford, Woodhouse, N. Finchley, second. Mr. W. Tipler came third. In class 11, for half a dozen bunches of decorative varieties, the winners were Mr. J. French, Ambleside, Wimbledon Park, with Cheveur d'Or, Cannell's Favourite, Lady Onslow, and Mrs. Filkins; second, Mr. G. W. Fortes, Regent House, Surbiton; and third, Mr. H. Humphrey, Roydon, Ware.

The table filled with single flowering Chrysanthemums was quite a feature. Mr. G. W. Forbes, Regent House, Surbiton, was first for six bunches, having the following varieties: Earlswood Beauty, Lady Sarah Wilson, Felis, Earlswood Glory, Lady R. Buller, and White Pearl. Mr. J. French was second, and Mr. Chas. Bentley, Cedar Court, Roehampton, third. Mr. Forbes again led for six large small-flowered singles, having Carrie Morgan, Lily Anderson, Little Pet, Miss Annie Holden, Souvenir de May Stevenson, and Mrs. D. B. Crane. Mr. J. Lock was second, and Mr. J. French third. For six vases of small-flowered pompons, Mr. W. C. Pagram's was the only entry, the varieties being Primrose League, Snowdrop, Perfection, and Petit Nid. Mr. W. G. Pruddon-Clark of York Road, Hitchin, led in class 20, and second, Mr. E. H. Palmer.

We are gratified to have to record a brisk competition for the vase of pompon Chrysanthemums, for which Mr. D. B. Crane was first, Miss C. B. Cole second, and Mr. J. Kirkwood, of Finchley, third. As shown by Mr. Crane and Miss Cole, these are very sweet little flowers. The latter used Snowdrop and Primrose League. In the prior class (13), for a vase of Chrysanthemums, Mr. A. Newell, of Fairlawn, Wimbledon Common, beat Mr. J. Lock, of Weybridge; and third, Mr. J. French, of

Wimbledon Park. There were eight vases. The decorative classes were well represented, and more satisfactory than usual. Miss C. B. Cole was first, Mr. J. French second, and Mr. A. Newell third for a hand basket of the flower.

The AMATEURS' DIVISION commenced at class 16, for a dozen Japs. Here Mr. H. Love, 1, Melville Terrace, Sandown, I.W., led with very fair flowers; second, Mr. W. Tipler, Hartwell Villa, Aylesbury; and third, Mr. F. Bush, Rose Hill, Totteridge. Mr. L. Gooch, of Frocester Lodge, South Norwood, with six fine Japs (class 17), beat Mr. M. Rayment, of North Ockendon, Romford; and third, Mr. T. L. Turk, Southwood House, Highgate. Here there were eight competitors.

Mr. A. R. Knight, of Ashford, was first in class 19, for six Japs, Mr. W. G. Prudder second, and Mr. M. Silsbury, Shanklin, I.W., third. Mr. T. L. Turk had the best vase of this flower; the second going to Mr. H. Pestell, and third Mr. C. H. Martin; Raymead, Hendon, out of seven. Another seven competitors were forward in class 21, the winners here being Mr. W. Gooding, Edenbridge, Kent; D. B. Crane, and F. G. Oliver, in this order.

#### Non-competitive Exhibits.

Amongst the non-competitive exhibitors were Lady Pigott (gardener, Mr. John Fleming), Wexham Park, Slough, who again staged model specimen plants of Begonia Gloire de Lorraine and Turnford Hall. The plants were 2½ ft high, and as broad, and massed with flowers (Gold Medal).

Messrs. W. Cutbush and Son, of Highgate, sent tree Carnations, including the white Mrs. S. J. Brooks, Mrs. Thos. Lawson, Gen. Maceo (very deep dark crimson), America, and Sir Hector Macdonald.

Messrs. H. Cannell and Sons, of Swanley, contributed their usual magnificent display, comprising Chrysanthemums on one side and Zonals on the other. The thread-petalled varieties and singles, for which Messrs. Cannell have a reputation, were considerably shown. Of the Japs, Gen. Hutton made a fine bank of showy flowers, and the new white Dorothy Pywell was also largely staged. Lady Marcus Samuel is a pretty lilac variety of very good form. Madame P. Radaelli was also included (Gold Medal).

Mr. H. J. Jones, Ryecroft, furnished half of the west end of the Aquarium and Mr. Norman Davis filled the other half. In Mr. Jones' collection there were really handsome flowers of the following novelties: Dorothy Pywell, Gen. Hutton, Mrs. E. Thirkell, Madame Paolo Radaelli, Mrs. F. Grimwade, also a seedling, deeper yellow than Bessie Godfrey, Geo. Lawrence, C. Jarvis, and Phyllis, a Japanese incurved. He also had Glory, an intense yellow decorative variety of great merit; and a number of fine incurved flowers (Large Gold Medal).

Mr. Davis was strong as usual in Mrs. Mease, G. J. Warren, and Madame Carnot. His group also contained some novelties, and fine decorative varieties, including Anemone-pompons, pompons, and singles. It was very finely staged (Large Gold Medal.)

Mr. W. J. Godfrey, of Exmouth, staged amongst others, Bessie Godfrey, Loveliness, Duke of Devonshire, Mrs. D. V. West, and The Bishop; whilst amongst decoratives he had Scarlet Prince, Magoya, and Golden Prince. Mr. Robert Foster, Nunhead, contributed a group, and obtained a Silver-gilt Medal; while Carnations in pots and cut blooms of the same in glasses were sent by Messrs. Geo. Boyes and Co., of Aylestone Nurseries, Leicester. Mr. Charles Blick (gardener to M. R. Smith, Esq., Warren House, Hayes), received a Gold Medal for a table filled with splendidly grown Lorraine Begonias.

Messrs. Wm. Clibran and Son, Altrincham, delighted visitors with a collection of single-flowered Chrysanthemums, including Mrs. F. R. Brown, white; Miss N. Charleton, reddish bronze; Mrs. E. Roberts, lilac-pink; Clibran's Yellow; Etoile de Feu; Lady Brooke, crimson; Lily, a large white; Verte Poitevine, very beautiful, greenish. Amongst their seedlings the following, under number, were very fine:—45, 62, 13, and 61.

Mr. Pattison exhibited his improved horse lawn shoes.

#### Leamington, Warwick, and District, Nov. 19th, 20th, and 21st.

This society held its annual show in the "Winter Hall" at Leamington on the above dates, and the high quality of the exhibits throughout elicited many high encomiums from the numerous horticulturists and visitors present on the opening day. Cut blooms, groups, fruit, decorated dinner-tables, wreaths and crosses were the great features of the exhibition.

In the matter of music, Leamington fully upheld its high reputation, as the Blue Hungarian Band played to delighted audiences during each day of the show. The arrangements in connection with the horticultural section were admirably managed by Mr. A. J. Nichols, the popular secretary, and Mr. R. Jones, assisted by a numerous committee. Unfortunately, the exhibition was not a financial success.

Cut Blooms.—In the class for twenty-four Japanese, distinct, Mr. A. Chandler, gardener to Arthur James, Esq., Coton House, Rugby, followed up his many successes of previous years by again securing the premier award. His flowers were, as usual, large,

deep, and well finished. Among the many fine blooms the following were conspicuous: Lord Ludlow, Ethel Fitzroy—both were similar in colour, orange and bronze, the former being a faultless flower with lovely drooping petals—Mafeking Hero, Florence Molyneux, Australie, Duchess of Sutherland (golden yellow), Sir H. Kitchener, Mrs. J. Bryant, Madame Cadbury, and Mrs. Bagnal Wilde. Mr. R. Jones, gardener to C. A. Smith-Ryland, Esq., Barford Hill, Warwick, was second with an even, well-arranged stand, W. R. Church, Mafeking Hero, Madame Carnot, and Mrs. T. Carrington being staged in fine form. The Leamington Nursery Company (Mr. Harper, manager) were a close third.

The silver cup offered by the Mayor of Leamington for twelve incurved and twelve Japanese was secured by Mr. C. Ritchings, West Malvern. The Japanese were weighty, but lacked finish. J. Upton was, however, grand, and decidedly the finest bloom in the stand; Mrs. Mease being also good. The incurved, although a heavy, even lot, were not conspicuous for their finish. Mr. Chandler secured the second position with a less weighty but well finished exhibit; the Japanese were especially good, but a few weak incurved flowers turned the verdict against him. Mr. Jones was third, his best flowers being Mrs. J. C. Neville, Vicar of Leatherhead, C. H. Curtis, W. Tunnington, and Duchess of Fife.

For a dozen incurved, Mr. Chandler was again to the fore; being followed by Mr. Jones and Mr. J. V. Macdonald in the order named. Mr. Chandler also won for twelve Japanese, being followed by Mr. Jones and Mr. J. Lloyd, gardener to Lord Willoughby de Broke, Compton Verney. The best six Japanese were staged by Mr. Chandler, who showed Lord Ludlow, Vivian Morel, and Madame Louis Remy in fine condition. Mr. Lloyd won in the class for the best arranged vase of Chrysanthemums cut with long stems. Wreaths, crosses, and bouquets made a beautiful display. Mr. C. Finch, Leamington, was first for the best bouquet and the best wreath, and Mrs. Greatley won for the best cross.

**PLANTS.**—The Leamington Nurserymen and Florists' Company won the chief awards for a group of Chrysanthemums and for a group of miscellaneous plants, in each case being followed by Mr. W. Vause. The exhibits in the latter class were particularly good, forming one of the chief attractions in the show, and they were also very close in point of merit. Special prizes were offered for decorated dinner-tables, and four excellent arrangements were staged, which gave the judges a good deal of difficulty in making their awards. They were as follows:—First, Mr. R. Greenfield, Leamington; second, Mr. Vause; third, Mr. E. M. Garlick.

**FRUIT.**—Both Grapes and Apples and Pears made an excellent display, and was more largely shown than usual. Mr. H. Liney, gardener to W. M. Low, Esq., Wellesbourne, was the proud winner of a silver cup offered for the best four bunches of Alicante Grapes, and he deserved the honour. Mr. W. Draper, gardener to R. C. Milne, Esq., Leamington, won for white Grapes with good Muscats; and Mr. J. Lancok, gardener to Captain Starley, was first for three bunches of black Grapes. Mr. Chandler won the prize offered by Messrs. Thomson, Clovenfords, for the best two bunches of Grapes, staging fine Muscats. Mr. R. Jones was first for three dishes of Pears, and for a like number of culinary Apples; and Mr. Chandler finished well by winning for three dishes of dessert Apples.

For a collection of fruit, first, Mr. E. Crumap, with beautiful samples of Royal Leamington Grapes, and many good dishes of Apples and Pears; second, Mr. J. Lloyd.

### Dundee Chrysanthemum, November 20th, 21st, and 22nd.

This exhibition took place in the Drill Hall on the 20th, 21st, and 22nd inst., and was a most satisfactory exhibition. Though not quite so large as in some recent years, quality was apparent in all classes.

**CUT FLOWERS.**—The leading class was for twelve vases Japanese, three blooms in each. First prize, of a gold medal and £5, was carried off by Mr. Beisant, with large, handsome, well-finished blooms. The additional week had suited Mr. Beisant, as his blooms were much better than those he showed at Edinburgh. The sorts were Sensation, Mrs. Barkley, Mrs. Geo. Mileham (very fine), Lord Kitchener, J. R. Upton (superb), Miss Elsie Fulton, W. R. Church, Calvat's Sun, Mrs. Greenfield, Marquise V. Venosta, Lord Ludlow, and Mons. Chenon de Leché. Mr. D. Nicol, Forgandenny, was a close second, his best blooms being Mrs. Mileham, Lord Ludlow, Madame Cadbury, and J. R. Upton.

For twenty-four blooms Japanese Mr. Beisant was again first with a most meritorious stand; Mr. Cumming, Grandtully Castle, a good second. Mr. Beisant was also first for eighteen blooms, and Mr. D. Nicol second. In the amateur classes Bailie Melville (president of the society) carried off the cup for twelve blooms, with an attractive and meritorious stand.

**POT PLANTS.**—These were splendidly shown, the best specimens being superior to either Edinburgh or London. For four pots Mr. Hendry, Taypark, gained first with very fine, well trained, and finely bloomed specimens; the second and third, by Messrs. Scott and Brown, were also good.

For table of cut flowers and plants two very attractive exhibits were made, which greatly enhanced the appearance of the hall. Mr. Fairweather, West Ferry, was awarded first, and Mr. Scott second. Among miscellaneous plants Begonia Gloire de Lorraine was a most attractive feature, the first prize four, from Mr. D. Saunders, being excellent specimens, full of bloom. The others were also good.

Bouquets were a good class. The first prize, one of nice yellow blooms, was most elegant, from Mr. Brown, Balcarin, Dundee. Decorative vases were also good. Fruit was a small show, but of good quality, Mr. Leslie, Pitcullen, Perth, gaining the premier prize. Vegetables were plentiful and good, a collection of eight kinds having three competitors. The first, from Mr. J. Kinnear, was most excellent.

There were a number of non-competitive exhibits of much merit, the most attractive feature of the show being a table of floral designs by Messrs. Laird and Sinclair, nurserymen, Dundee. Bouquets, harp, baskets, cross, wreath, &c., were elegantly executed, and were attractively arranged, though reminiscent of

Carnation, Miss F. Sims; reduced  $\frac{1}{2}$ .

The colour of this new self is rich maroon. It is of great substance, perfect petal, and of large size. It was shown at the Midland Carnation and Picotee Society on August 7, 1902, taking first prize in its class, and was also the premier bloom. It was awarded a certificate at the same time. Two flowers must be shown for a certificate, one dressed on a card, the other as cut from the plant. The above illustration shows a dressed bloom, somewhat reduced in size. Miss F. Sims is a cross between two seedlings raised by Mr. C. H. Herbert, grower to Messrs. Thomson and Sons, Sparkhill, Birmingham. This photo was taken four days after the flowers were cut, and they were at an exhibition two days.

a larger exhibit in Edinburgh the previous week. Messrs. Laird also exhibited a handsome collection of hardy shrubs.

Mr. R. Grossart, Dundee, exhibited a table of plants, varied and well grown; also some handsome bouquets, wreaths, &c.

Messrs. Storrie and Storrie, Dundee, had a table in which fruit and fruit trees formed the leading feature, showing the suitability of their Carse o' Gowrie nurseries for fruit culture.

Messrs. D. and W. Croll had an exhibit of cut Roses, which were remarkably fine for the late period of the season.

Messrs. Wells and Co., Earlswood, Surrey, sent an attractive exhibit of new Chrysanthemums, which proved most interesting to visitors, the rich crimson S. T. Wright being very prominent.

### Manchester, November 20th, 21st, and 22nd.

The North of England Orchid Society held its usual fortnightly show in conjunction with the Chrysanthemum Society's show. Mr. Weathers, from the Botanical Gardens, had arranged a huge group with effective skill, and was warmly to be commended, as was his assistant, Mr. Paul. One of the most conspicuous tables of fruit ever displayed was sent by Mr. N. F. Barnes, gardener to His Grace the Duke of Westminster, Eaton Hall. Apples, Pears, Grapes in dainty baskets, autumn foliage and flowers, correct of name, formed a fine object lesson to visitors, the gold medal award being justly earned.

Messrs. H. Cannell and Sons, from Swanley, Kent, had wonderful Zonal Pelargoniums, and also Chrysanthemums (silver medal). Messrs. W. Clibran and Son, Altrincham, had many new single seedling Chrysanthemums, Mrs. E. Roberts, Mrs. H. Herbert, Stella, &c., being grand. Two new incurveds, *Souvenir de Wm. Clibran*, a heavy and beautiful white, and *W. Biddle*, bronzy yellow, should be watched. Their *Celosias* are now too famed to describe here, and other plants made a handsome group (silver medal). Messrs. W. Wells and Co., Earlswood, showed singles and other novelties in their best style.

**Cut Blooms.**—For the Manchester Challenge Cup (value twenty-five guineas), with cash (£10) presented by John Wainwright, Esq. Mr. C. Crooks, gardener to the Dowager Lady Hindlip, Droitwich, proved victorious in winning the cup outright. Mrs. Mease, W. R. Church, M. Louis Remy, Mrs. Barkley, J. R. Upton, *Le Grand Dragon*, Lord Ludlow, Madame Herrewége, J. R. Thorneycroft, Madame Cadbury, Mons. Pancoucke, G. W. Palmer, *Calvat's Sun*, Madame P. Radaelli, *Australie*, Kimberley, Matthew Smith, G. J. Warren, Lord Salisbury, Nellie Pockett, *Graphic*, *Calvat's '99*, Madame Carnot, and Mrs. Coombes, with the incurveds *J. Agate*, *Ialene*, Madame Ferlat, Mrs. H. J. Jones, Duchess of Fife, C. H. Curtis, Mdle. Lucie Fanre, Nellie Stevens, Countess of Warwick, Hanwell Glory, F. Palmer, Nellie Southam, Mrs. C. Crooks, Colonel Keke-wich, Nellie Threlfall, Lady Isobel, Lord Alcester, *Ma Perfection*, Bonnie Dundee, Mrs. F. Judson, *Golden Empress*, Annie Hills, *Empress of India*, and Louisa Giles were the blooms in his collection. Mr. C. J. Salter, gardener to Mrs. T. B. Haywood, Woodhatch Lodge, Reigate, was a strong second, and Mr. J. Goodacre third. The class for thirty-six Japs, eighteen varieties, was a noble one, Mr. Hall, gardener to Lady Ashburton, Romsey, taking first honours. Mr. C. J. Salter was a grand second, and Mr. J. Stoney, gardener to F. H. Gossage, Esq., Camp Hill, Woolton, an admirable third. For eighteen Japs Mr. Crooks and Mr. Hall, with Mr. A. H. Hall, gardener to J. C. Waterhouse, Esq., Prestbury, were placed so. Mr. Stoney, for twelve, gave a fine account of himself; Mr. Hall second, and Mr. A. H. Hall third.

To Mr. G. Haigh, gardener to Sir W. Tate, Bart., Highfield, Woolton, the greatest credit is due for the superb twenty-four incurveds: each handsome and free from a taint of coarseness. The names ought to prove useful to beginners: *C. Bruant* (2), *Ialene* (2), *J. Agate*, C. H. Curtis (2), F. Palmer (2), *Topaze Orientale*, Lady Isobel (2), F. Molyneux (2), *Queen of England*, Mrs. Higgs, W. Tunnington, Madame Ferlat (2), F. Hammond, Mrs. H. J. Jones, Duchess of Fife, Hanwell Glory, and General Symonds. Mr. Crooks came a brilliant second, and Mr. Stoney third. Messrs. Haigh, A. H. Hall, and F. Ashworth won for twelve.

The class for miscellaneous blooms serves to keep up every section, and ought to be more liberally encouraged by societies generally. Mr. C. J. Salter here reaped a rich reward, *Anemones* and reflexed showing to much advantage; Mrs. W. W. Moulton and Miss M. A. Lightbourne second and third. The local classes were nicely filled.

**PLANTS.**—Such superbly grown specimens are only rarely met with, the position on the orchestral platform suiting to a nicety. J. Brown, Esq., won with nine and six, all up to exhibition standard. A. R. Kelly, Esq., for six pompons. Liberal were the prizes for groups of foliage plants and Chrysanthemums, the foreground boldly displayed with the former is a distinct advantage to the cramming so often met with.

Baskets and other floral work were up to usual high standard, with miscellaneous plants well to the fore. The winners were Messrs. Robinson, Derbyshire, Garner, Harker, Gorton, Walton, and Brown. Messrs. Dickson and Robinson, and Dickson, Brown, and Tait represented Manchester thoroughly; some plants of *Begonia Caledonia* in the former being particularly well grown. Manchester is noted for large undertakings, and Mr. Weathers is to be congratulated on trying to make horticulture take its share.—R. P. R.

At the above show specimen plants were numerous, and quite the best in point of quality seen this season, the later date of this show having been favourable to the full development of the blooms. Cut flowers were numerous and good, the compe-

tition being keen all through. In class 7, for thirty-six Japs, Mr. G. Hall, of Melchet Court, just succeeded in beating Mr. Salter for the premier award with a stand of even, full-sized blossoms. So good were they that we give their names as a guide for future use: Mrs. Mease (2), *Marquise V. Venosta* (2), *Le Grand Dragon* (2), T. Carrington (2), General Hutton (2), Madame Carnot (2), Madame Paolo Radaelli (2), *Australie* (2), Matthew Smith, Nellie Pockett (2), Charles Longley, Mrs. Barkley (2), Lord Ludlow, Lord Salisbury, Mrs. Hummell (2), Edwin Molyneux, *Calvat's Sun*, Madame Cadbury, Mrs. Greenfield, Madame Herrewége, W. R. Church, M. Louis Remy, *Calvat's '99*, Mrs. Lewis, Mrs. G. Mileham, and Mons. Chenon de Leché. Twelve Japanese distinct was a very strong class, so keen was the competition and good the blooms. Mr. Stoney was distinctly ahead with a level lot. Incurved varieties in classes set apart for this section were thoroughly well represented; no fewer than eight staged twenty-four in not less than twelve varieties.

An interesting class was that for thirty-six miscellaneous blooms, to include not less than six Japanese, six incurved and the same number of reflexed varieties. Five competed. John Boxall, T. F. Brock, Golden, Pink, and White Christine were noteworthy in the reflexed section. The *Anemone* flowered varieties were remarkably fine. So seldom nowadays do we see a stand of these that the names as staged will serve as a guide to future growers: R. P. Dunn, Mrs. Hugh Gardiner, *Owen's Perfection*, John Bunyan, W. W. Aston, *Halcyon*, Grand Alveole, *Souvenir de Norgoits*, and Delaware. Pompon plants were capitally represented, the plants being trained in pyramid form, well clothed with healthy foliage, and, as a rule, profusely covered with bloom.

### Manchester Orchid.

It was a great gain in every respect that the Manchester Orchid Society should hold their show in connection with the Chrysanthemum exhibition, visitors having a double treat in store.

Messrs. Cypher of Cheltenham made a very excellent display, for which they received the society's gold medal. Many plants of *Cypripedium Sanderæ* were there, handsome forms of *Cypripedium Leeanaum* and *C. giganteum*, and the Harefield Hall variety, *Dendrobium Phalaenopsis* in charming colours, and last, but by no means least, *Cypripedium Fascinator*, which so admirably partakes of both its parents, *hirsutissimum* and *Spicerianum*. Also the special prize by Mr. Gratrix. Another most deserving firm of Gold Medallists were Messrs. Charlesworth and Co., Bradford, whose *Oncidium tigrinum* and *Forbesi*, *Cypripedium Schröderæ*, a lovely cross between *ænanthum superbum* and *Fairrieanum*; and *Cypripedium Ernesti*, with splendid hybrids, to be heard of anon.

Messrs. John Cowan and Co., Gateacre, always reliable for a good show, gained the silver medal for a very choice lot of *Cypripedium Sanderæ*, *Elmirianum*, *Leeanaum giganteum*, and some specially fine forms of *Odontoglossum grande* being very pronounced.

To Messrs. Hugh Low went another silver medal with not a large collection, but how telling they were! *Cypripediums*, Harefield Hall var., *Leeanaum magnificum*, G. S. Ball's var., *insigne Sanderæ* M. Jules Hye, *Odontoglossum Ruckerianum*, and *Cattleya labiata Amesiana*, with white petals and pink lips, were specially good.

Thomas Statter, Esq., had as fine a collection as one could wish for; *Cypripediums*, of which *insigne Sanderæ* took the lead. Two lovely pieces of *Cypripedium triumphans* of the brightest colour, besides other novelties, a silver-gilt medal being none too good, S. Gratrix, Esq., had some very fine forms of *Leeanaum*, and received a F.C.C. for *Cypripedium Coronis*, very extra *Dayana x bellatulum*. A silver medal went to Mr. R. Ashworth for magnificent spotted forms of *Odontoglossums* and capital *Cypripediums*.

Mr. Jno. Robson can always be relied upon, and he quite kept up the Manchester reputation with a particularly varied lot, including many fine novelties. The Messrs. Holmes and Duckworth also kept things up to date, their contribution telling most distinctly against some of the larger ones. We missed W. Thompson, Esq., of Stone, but he can always be depended upon at other meetings.—R. P. R.

### Norfolk and Norwich, November 20th, 21st, and 22nd.

This is one of the oldest societies in the country, having been established in October, 1829, and it holds three exhibitions: a spring show in April; a Rose show in July, which includes plants, fruits, and vegetables; and a Chrysanthemum show in November. The latter was held, as usual, in St. Andrew's Hall, the fruit and vegetables finding places in a smaller hall. The society had considerably augmented the prizes offered for Chrysanthemums, and the amount of £145 was allotted to the classes. The Chrysanthem-

mum show is always held in the same week as the Norwich Fat Cattle Show, and, like the latter, it has become a county institution. The weather was fine on the opening day, and there was, as usual, a very large attendance.

The adoption of a vase class for six varieties of Japs, three specimen blooms of each, aroused much interest, and it proved a great success, the competition being numerous and keen. It also made a welcome break from the straight lines of specimen cut blooms on stands. The first prize fell to the lot of B. E. Fletcher, Esq., Mallingford Hall (Mr. G. Baker, gardener). His varieties were Madame Carnot, J. E. Clayton, N.C.S. Jubilee, &c. Lord de Ramsay, Haverland Hall (Mr. G. W. Mush, gardener), was second. His best blooms were Mr. A. Barrett, Nellie Pockett, and Chas. Davis. Lord Walsingham, Merton Hall (Mr. W. Riddell, gardener), was third. There was a class for three vases also, in which there was a good competition.

The class which created the greatest furore among the visitors was that for forty-eight Japs, in which the competition was very keen. The first prize fell to the lot of Sir Saville B. Crossley, Bart., M.P., Somerleyton Hall (Mr. F. Hanson, gardener). His most prominent blooms were Madame Gustave Henry, W. R. Church, Mrs. Mease, M. L. Remy, Matthew Smith, Sir H. Kitchen, Lady Roberts, and Miss Nellie Pockett. Second, W. R. Seago, Esq., Oulton Hall (Mr. G. H. Smart, gardener), with blooms only a little inferior to those from Mr. Hanson, and of much the same varieties. A nearly model bloom of W. R. Church in this collection was awarded the Silver Medal of the National Chrysanthemum Society as the premier Jap. Mafeking Hero, Lord Ludlow, Mrs. J. Lewis, Miss Nellie Pockett, Princess A. de Monaco, and Florence Molyneux were also very fine on this stand. The class for thirty-six Japs, in no less than twenty-four varieties, brought a good competition also, Mr. G. H. Mush taking the first prize with a collection which included excellent examples of Miss A. Byron, Madame G. Henry, Swanley Giant, W. R. Church, &c. S. Morris, Esq., Wretham Hall (Mr. G. Henly, gardener), was a good second. Among his blooms were well finished examples of Etoile du Nord, Simplicity, Madame G. Henry, &c. The best twenty-four Japs came from F. Martin, Esq., The Grange, Wroxham, an even and fresh lot. Conspicuous among them were W. R. Church, Madame Carnot, Matthew Smith, Madame Von Andre, &c. B. Cooke, Esq., Aylsham (Mr. F. Matthews, gardener), was a good second. He had striking blooms of Mrs. J. Ritson, Madame G. Henry, Lady E. Clarke, &c.

The incurved section is never very strongly represented at Norwich. The first prize, twenty-four blooms, was a well finished collection. The most striking blooms were Madame Ferlat, selected for the Silver Medal of the N.C.S. as the best incurved bloom in the show. Unfortunately, the names of the exhibitors in this class were overlooked, but there were excellent blooms of C. H. Curtis, President Bevan, Lady Isabel, Mrs. R. C. Pilkington, &c. The best six incurved of one variety was C. H. Curtis, from Mr. J. Baker, Marlingford Hall. The best six white Japs were those of Mrs. J. Lewis, from Mr. G. H. Smart. The best six of any other colour, but white, was found in Mrs. Mease, from H. A. Campbell, Esq., Lynford Hall (Mr. F. Tilbury, gardener).

Some very fine blooms were shown by amateurs not employing a gardener. The best twelve came from Mr. H. J. Barnaby, of Dereham, who had excellent blooms of Miss A. Byron, Mrs. Barkley, W. R. Church, and others, being finely developed.

Fruit and vegetables were generally good, and some very fine Grapes came from Lord Suffield, Gunton Park, Norwich (Mr. W. Allan, gardener). Mr. Allan exhibited in nine classes for fruit, and secured eight firsts and one second—a highly commendable performance. Mr. Allan was first with three bunches of well finished Alicante; the Hon. A. E. Fellowes, M.P., Honingham Hall (Mr. Sheddeck, gardener), came second, also with excellent examples. The best three bunches of Muscat of Alexandria came from Mr. F. Tilbury, Lynford Hall; and Mr. Fison (Mr. A. Lane, gardener) was second. Well ripened and coloured berries were seen in both cases. Mr. Allan came in first with three varieties of Grapes. He had in fine condition Gros Maroc, Lady Downes, and Alicante.

Apples, both dessert and culinary, were good. In the class for nine varieties of dessert, six fruits of each, Mr. G. H. Smart, Oulton Hall Gardens, took the first prize with well balanced fruits. There were extra good examples of Cox's Pomona, Ribston Pippin, and Blenheim Orange. Mr. G. Baker came second. He had very good fruit of Gascoyne's Scarlet, Cole's Seedling, Peasgood's Nonsuch, &c. With nine dishes of culinary Apples Capt. B. J. Petre, Westwick (Mr. G. Davidson, gardener), was placed first. His leading sorts were Warner's King, Peasgood's Nonesuch, Gascoyne's Scarlet Seedling, Bismarck, Lane's Prince Albert, &c.

Potatoes were largely shown, and generally of fine quality. Messrs. Sutton and Sons offered special prizes for six dishes. E. J. Corbett, Esq., Honing (Mr. T. Jones, gardener), was placed first. The leading sorts were Sutton's Perfection, Sutton's

Favourite, Sutton's Seedling, and Sutton's Reliance. There were many prizes for vegetables, Messrs. Sutton and Sons and Daniels Bros. offering special prizes in several classes.

Specimen Chrysanthemums and other plants were shown, and there were pretty arrangements in flowers; but the time at our disposal admitted of notice of only a few of the leading features in a great show. Miscellaneous collections were shown by Messrs. Daniels Bros.—fruit, flowers, vegetables, &c. Mr. R. Holmes, Norwich, had a large and well flowered collection of Mums, lifted from the open ground last October; and Hobbies, Limited (Mr. John Green, manager), Derham, a large and imposing collection of Chrysanthemums.

### Metropolitan Public Gardens Association.

**OPEN SPACES.**—At the monthly meeting of the Metropolitan Public Gardens Association, held at 83, Lancaster Gate, W., the Earl of Meath (chairman) presiding, progress was reported with regard to the laying out of the Southfields Recreation Ground, Wandsworth, and with schemes for the conversion of St. Mary's Churchyard, Whitechapel, and All Saints' Churchyard, Poplar, into public gardens. It was stated that the London County Council had decided to appeal against the recent decision of the Consistory Court, authorising the erection of buildings on Holy Trinity Churchyard, Stepney, which had been for many years in use as a public garden, being one of the earlier schemes carried out by the Association.

Applications were received from the Shoreditch and Stepney Borough Councils for the planting of trees in suitable thoroughfares in their respective districts, the latter body stating that they had no legal power to expend money in this desirable manner. It was resolved, should such be found to be the case, to take steps to secure an extension of the law in this respect. Numerous designs of drinking fountains in Paris, which the chairman had procured through the kindness of the British Ambassador, were inspected, and were considered a great improvement on the designs of fountains hitherto erected in London. Some of these were erected in Paris by the late Sir Richard Wallace.

It was decided to protest against any alienation of the house and adjacent ground at Golders Hill for the purposes of a convalescent institution, as being entirely contrary to the terms upon which the London County Council hold the estate for public use and enjoyment. It was also decided to point out the illegality of any part of a park at Sydenham being devoted as a site for a public library. It was agreed to give hearty support to Mr. E. N. Buxton's scheme for acquiring some 900 acres of land, formerly part of Hainault Forest, and to assist in any efforts made to raise the sum of £10,000, which the City Corporation had at its last meeting refused to grant. An interesting letter was read from Mr. Chance, of Edgbaston, stating that, acting upon suggestions made by the association, a scheme for the purchase, for public enjoyment, of Lightwood's Estate, sixteen acres, for £11,500, had been carried to a successful issue by voluntary effort. It was agreed to urge the formation of a local open space society for the Birmingham district.

### Meteorological Observations at Chiswick.

Taken in the Royal Horticultural Society's Gardens at Chiswick, height above sea level 24 feet.

| Date.         | Direction of Wind. | Temperature of the Air. |           |           |           | Rain.       | Temperature of the Soil,<br>At 9 A.M. |                |                | Lowest Temperature on Grass. |

## Obituary.

Mr. Edward Brown, jun., of Southampton.

It is with much regret that we have to record the sudden death of Mr. Edward Brown, jun., eldest son of Mr. Edward Brown, J.P., of Above Bar and Hill Lane, Southampton, which occurred at his residence, Hughenden, New Alma Road, Southampton. Mr. Brown was a very enthusiastic and successful cultivator of the Chrysanthemum, as well as being a good all-round horticulturist. He was also without doubt one of the most bonâ-fide amateurs that exhibited; he did the whole of the work connected with his great hobby with his own hands, from striking the cuttings, through all the various stages until ready for exhibition. He kept in his note-book a strict record of all the cultural operations for future reference. This year, with only between 130 and 140 plants housed at one time, he was able to exhibit twelve blooms at the October Show of the N.C.S., seventy-eight at Southampton, twenty-four at Portsmouth, and twenty-four at Winchester, winning seven firsts, one second, and one third prizes. He was also awarded two silver medals at Southampton, being the most successful exhibitor both in the divisions open to gentlemen's gardeners and amateurs and open to amateurs only. This is a record that will probably never be attained by any other amateur. In fact, Mr. Brown was just one of those members who could be ill-spared by any society, and whose place it will be difficult to fill.—F.

## NATIONAL FRUIT GROWERS' FEDERATION.

We have received the following letter: "I beg to call your attention to the objects of this federation, which has been formed for the protection of the interests of fruit growers and market gardeners. You are probably aware from experience that the industry now labours under serious disadvantages as regards railway rates and want of suitable conveyances and quick transit for perishable goods, but perhaps few fully realise the unfair character of the competition to which British produce is exposed, and with which nothing but a powerful combination of a national character will be able to cope.

A provisional executive committee has been formed comprising representatives from the various fruit growing districts of England, and the names of these gentlemen should inspire confidence that the business of the federation will be efficiently carried out. In order to make the movement as successful as it should be, a large membership is necessary, and for this reason the subscription has been fixed at the low sum of 10s. It is earnestly hoped that you will not only join the federation yourself, but that you will also endeavour to make its existence and objects known to your friends. A copy of the rules will be sent on application. Cheques should be made payable to the secretary, and an official receipt will be forwarded for all subscriptions. Trusting to receive an early and favourable reply, and that I shall have the pleasure of enrolling you as a member.—A. T. MATTHEWS, Secretary, 28, Eaton Rise, Ealing, London, W."

We append a copy of the objects of the federation:—

"The objects of the federation are to create a permanent central organisation representative of the fruit growers and market gardeners of the United Kingdom, for the promotion of their common interests as a whole, while reserving perfect local liberty of action to the constituent members.

- (a) To prevent by every possible means the granting by railway companies of preferential rates and facilities for the carriage of foreign fruit and market garden produce.
- (b) To secure quicker means of transit and fair rates from railway companies, and consider complaints which are likely to be ignored by companies when made by individual members of the federation.
- (c) To prevent jams made of foreign fruit being sold by misdescription, misrepresentation, or implication, as being made of home-grown fruit, and to urge the distinct labelling of British fruit jams; and also to prevent the sale of fresh fruit, either wholesale or retail, by misdescription or misrepresentation.
- (d) To affiliate with any other kindred society or societies.
- (e) To promote, support, or oppose legislative or other measures affecting the aforesaid trade.
- (f) The doing of all such things as may be conducive to the prosperity of fruit growers and market gardeners, or incidental to the attainment of the above objects.
- (g) The collection and dissemination of statistical and other information relating to the fruit-growing industry."

## Fertile Workers.

The production of what is termed a fertile worker is due to the larvæ of any ordinary worker bee not being weaned at the proper time, the continuance of the extra nourishing food, called "royal jelly," causing a partial development of the ovaries. The ovaries in the ordinary worker, reared from a similar egg (the larvæ being weaned at the proper time), are very rudimentary, simply consisting of a few thread-like tubes, without a vestige of either eggs or germs. In consequence of these fertile workers being physically incapable of mating with the drones, they are only able to deposit eggs which will produce males. They are a great nuisance in an apiary, and at times cause considerable annoyance, taxing the bee-keeper's ingenuity and readiness of resource to rid himself of them. They generally appear in a colony which has been without a fertile queen for some time, and as this rapidly results in weak colonies, the condition of such a stock demands serious and prompt attention, as procrastination will only still further lessen the number of the inhabitants of the hive. Owing to the actions of the bees when in possession of a fertile worker being apparently similar to those when headed by a fertile queen, it will easily be understood that great difficulty is experienced in finding her. If a stock has been queenless for any lengthy period, it is always necessary to thoroughly examine it, and observe closely the actions of the bees. Many a valuable queen has been killed by attempting to re-queen such colonies without first ascertaining the exact condition of the colony. The fact that a fertile worker does not differ in outward appearance from her other sisters adds to the difficulty of detecting her, and unless the apiarist is fortunate enough to capture her in the act of depositing eggs, her discovery is practically impossible.

One of the reliable signs of a fertile worker being present in a hive is the irregular manner in which the eggs are laid, probably six or more in a cell, and also the manner in which the cells are capped over. Although the brood is in worker cells, the cappings are raised exactly like drone cells. The peculiarity regarding the number of eggs in a cell may also be found with a young prolific queen when she is cramped for room, or when the paucity of bees compels her to lay more than once in the cells which they can comfortably cover.

There is this notable difference, however, between the two methods of ovipositing—the young queens lay theirs compactly, not a cell overlooked, whereas the fertile worker, whose ovaries are only imperfectly filled, will occasionally miss a cell altogether, giving the eggs a scattered appearance. In getting rid of one, the knowledge that she has never left the hive to meet the drones for fertilisation is sometimes taken advantage of. The hive is removed bodily to a distance and an empty one put in its position; the bees are then thrown from the frames on the ground, and they immediately begin to return to the old location, while the fertile worker, being unable to find her way back, is lost. This is a simple, but not an infallible plan, as by some means she will occasionally find her way back to the old spot. Should this occur, and she still persists in laying, a plan which involves more trouble, but is more certain, is to open the hive on a fine day, shake all the bees off the bars into the hive, removing all the bars but those containing brood, and placing them on one side. Now replace the quilts above the fertile worker, bees, and brood, and place it in a different position, standing a fresh hive in the old spot, with the combs previously removed inside, and a bar of brood in all stages taken from another colony when practicable.

Those bees which accompanied the fertile worker having marked the old position, will very soon all return, and the bar of brood causes them to remain; otherwise, if left without either queen or brood, they would disperse among the other hives. The fertile worker by this plan is left with her brood, and probably a few workers and drones, to die off or to be destroyed by robbers. There is one point which must be emphasised, viz., the uselessness of

introducing virgin queens to a colony in possession of a fertile worker. Instead of getting rid of the pest by this means, it will be found that the virgin is generally dragged out at the entrance dead in a very short time; but this invariably occurs sooner or later.

The best plan, where it can be carried out, is to introduce a fertile queen on a bar of her own brood, and bees to the stock in a similar manner to uniting. The abnormal condition of things is soon manifest to the bees accompanying the fertile queen, and there is a rapid end to the fertile worker's ovipositing. If the stock should be weak, from neglect or any other cause, and it is not considered advisable to re-queen it, uniting should be resorted to.—E. E., Sandbach.

## Young Gardeners' Domain.

### Pentstemons.

These are amongst the few things that have been a success during this sunless summer. The dull, cool atmospheric conditions prevailing, resulting in free, vigorous growth, whilst rarely has there been that absolute purity of colour that has characterised the bloom this season. Hitherto our northern friends, having a monopoly of beneficent atmospheric conditions, have led the way wherever they have exhibited these charming flowers; but, judging by what has been presented to us by south-western growers (notably Messrs. I. House and Sons, Bristol), one feels inclined to venture the query "Stands Scotland where it did?" so far as the cultivation of the Pentstemon is concerned.

October is not a month in which one expects to find a brilliant display of colour in the garden, save, perhaps, amongst the early Mums and their more sombre brethren, the Michaelmas Daisies; but brilliant hardly adequately describes the view presented by the beds of Pentstemons when I visited Messrs. House's nurseries at Westbury-on-Trym during the early part of October. Many of the best spikes of bloom had been cut at the time of my visit for the shows, and from plants cut down thus early the first batch of cuttings were being taken. These are prepared in the same way as the typical bedding *Calceolaria*, but instead of their being inserted direct into soil in a cold frame, single pots (60's) are used; these are filled with light sandy soil, one cutting being inserted in the centre of each pot. These are then plunged in a cold frame, well watered, shaded, and kept close for about six weeks.

So soon as the cuttings are rooted, air is gradually admitted in order to ensure dwarf stocky plants; finally the lights are removed altogether on every available opportunity, and here the plants remain until planting out time in April. To grow Pentstemons really well a bed or border should be afforded them; if sheltered from the north and east so much the better, otherwise their stately blooms are liable to be damaged by the wind.

Planted in bold groups of from ten to fifteen plants in well-prepared stations along the front row of the shrubbery, they create a pleasing effect, but the choicer varieties are well deserving a good position, either in the mixed border, or, better still, in isolated beds.

A deeply dug and well enriched soil is essential to their well-being; cow manure, owing to its cool retentive nature, suits them admirably, whilst fairly firm planting, a slight mulch, together with a good supply of liquid manure during the growing period, materially assists in the development of fine blooms. They bloom from early August until "chill October," and nothing presents a more pleasing show than a good bed filled with these charming flowers, their light and graceful deportment annihilating the all-prevailing monotony that seems inseparable from the autumnal garden.

As with so many of the florists' flowers, there appears to be a desire to unwarrantably extend the number of varieties, but a preponderance of dull, purplish-coloured varieties creates an impression altogether unfavourable to this beautiful flower; a really fine exhibit recently set up at the Drill Hall was unfortunately marred by a too liberal admission of dark coloured varieties. Whilst one would not willingly eliminate the darker shades if growing a large collection where only a limited number can be grown, they should be discarded in favour of the brighter shades of red and pink.

Amongst the newer continental varieties brilliant colours are more prevalent, and from personal observation during a visit to a really magnificent collection I selected the following as the cream of the varieties: *Ninon de l'Enclos*, *President Carnot*, *Lady Brodie*, *Melodram*, *Frœlich*, *Talma*, *H. Spencer*, *Phryne*, *Negresse*, *Wm. Cuthbertson*, *Napoleon Key*, and *Port Royal*.—E. J. Love, E. Dereham, Norfolk.

### Fruit Forcing.

**VINES: EARLIEST FORCED PLANTED OUT.**—To have a supply of ripe Grapes in May the Vines must be started at the beginning of December, nothing favouring a good start more than a good bed of leaves and sweetened stable litter placed on the floor of the house and turned daily. The outside border should have the needful protection from cold rains and snow; a covering of leaves or bracken with litter on the top so as to throw off rain, will be considerably warmer than if exposed, and in this case covering with fermenting material may be dispensed with; but a covering of fresh leaves so as to raise a gentle heat is preferable, especially to those wholly outside. The inside border should be brought into a moist condition by applying water, and in the case of weakly Vines, liquid manure. Avoid making the soil sodden by needless waterings, as Vines require only moderate root moisture until they start into growth. Start with a night temperature of 50deg in severe weather, 55deg in mild weather, and 65deg by day, except the weather be severe, when 55deg will suffice, not exceeding those figures until growth commences. Maintain a genial atmosphere by syringing occasionally, but avoid excessive moisture, as it excites the emission of aerial roots from the rods. Depress the canes of young Vines to the horizontal line or below it, to ensure the regular breaking of the buds.

**LATE HOUSES.**—Take every precaution against damp. Leaky roofs are a prolific cause of Grapes decaying; a single drop of water getting into a bunch of Grapes is sufficient to spoil it. Though the decay may only be a berry, it soon spreads, and ruins the whole bunch, especially when the faulty berry is in the interior, so that it escapes detection until the mischief is done. Remove all leaves as they become mature, affording only sufficient fire heat to maintain a temperature of 40deg to 45deg, admitting air on all favourable occasions; but close the house in damp weather, seeking to secure a dry, cool, equal temperature. Muscat of Alexandria and Canon Hall should have a temperature of 50deg, a genial warmth in the pipes constantly, so as to prevent the deposition of moisture on the berries; but when the weather is cold and sharp allow the temperature to fall 5deg, being careful not to allow the temperature to be much accelerated by sun heat or natural warmth without a free circulation of air.—ST. ALBANS.

### Kitchen Garden.

**FORCING RHUBARB.**—A batch of roots of fair size, with numerous and stout crowns, should be placed in a structure where a temperature of 60deg can be maintained. Moisture and heat combined seem to suit Rhubarb, and enable it to push readily into growth. For early forcing, clumps lifted several weeks ago and exposed to the weather have received the salutary check to growth rendered necessary before a start into fresh growth can be made. The best structure for forcing Rhubarb is one where semi-darkness is ensured, together with a regular temperature and humidity. Other positions may also be found, such as under stages or in warm pits. Except in positions where the air is of a very drying character, it is not essential, as a rule, to surround the roots with soil, but apply moisture freely by giving applications of water whenever the roots appear to require it. Failing a suitable position inside a shed or glass house, Rhubarb may be successfully forced in a frame filled with manure and leaves. If a hotbed is formed with a frame on the top, linings of fresh material will have to be frequently applied in order to maintain the necessary temperature. The moisture in the soil and the humidity in the atmosphere will usually be sufficient until actual growth is in progress without applying water.

**FORCING SEAKALE.**—Strong Seakale roots only should be selected for forcing. Such roots will have bold crowns, and the produce is likely to be substantial. Pack the roots together in pots or boxes in good soil, which maintain moist. Exclude light entirely from the crowns so that growth will be well blanched. If there is convenience in a suitable structure for placing the roots together in a bed of soil on the floor, a large number of roots can be readily accommodated, but the supply must be regulated by the demand. Water the roots and soil as soon as arranged. The temperature should not be too high, so as to avoid drawing up the growths weakly; 55deg to 60deg is ample.

**VACANT GROUND.**—Early opportunities should be taken to deal with vacant plots of ground. Assuming that a general idea can be formed as to how the ground is to be cropped the following year, a definite method may be followed in the preparation of the soil. For any and every crop it is highly desirable to stir the soil deeply, trenching, in fact, if the ground has only hitherto been cultivated in a shallow manner. Wherever

tap-rooted vegetables are to be grown the ground may be cultivated to a generous depth, working in manure to the lower spits, but avoiding mixing it in the upper. For gross-feeding subjects work manure well throughout the whole of the soil. Stiff, clayey, unkindly, adhesive ground requires in the first place to be broken up roughly, so as to well expose as much surface as possible to the action of the weather, which has a beneficial effect upon it in breaking down the stubborn particles. In spring the ground is then easily pulverised, and rendered more serviceable for the cultivation of crops generally.

**ONIONS.**—Bulbs should be kept perfectly dry in the stores, as they are liable to push growth if kept in a humid atmosphere. They are also susceptible to frost, and will soon be rendered useless if caught in a damp condition. There should be just enough heat and ventilation to maintain the air dry, when the bulbs will then stand a low temperature with safety.

**BROCCOLI.**—Open weather is favourable to early Broccoli turning in, but it will soon be injured by frost; therefore break some of the leaves over the heads of those which have formed, or are in the process of doing so. Clear away the stems and leaves of those which have been cut, also yellow leaves from advancing crops.—E. D. S.

\* \* All correspondence relating to editorial matters should be directed to "THE EDITOR," 12, Mitre Court Chambers, Fleet Street, London, E.C. It is requested that no one will write privately to any of our correspondents, seeking information on matters discussed in this Journal, as doing so subjects them to unjustifiable trouble and expense.

**PURCHASING CHEMICAL MANURES (C. C.).**—The prices given in Cousins' Primer are wholesale, or per ton quantities, at which the manure dealers advertising in our columns will, no doubt, be pleased to supply the respective articles; or, as the prices vary from time to time, be glad to quote price on application. We cannot depart from our rule not to recommend dealers, unless under special circumstances and without prejudice. Of course, the articles cannot be supplied in small quantities at the same rates as large ones, and in some cases it is not possible to secure even these, as the article asked for may not be in request for commercial advantage, and it would not pay to prepare it in small amounts. Business is a very different thing from matters treated theoretically and not from a practical standpoint, a thing quite as important to compounders as to users, but seldom considered in practice by writers.

**ROSES IN POTS (Amateur).**—The most suitable compost for Roses in pots is turfy loam rather stiff, with a fourth of well-decayed manure and a sprinkling of bone dust equal to a twentieth of the loam. The temperature of the house should not exceed 45deg to 50deg by artificial means until they are fairly in growth, when it may be raised gradually to 55deg at night and 60deg to 65deg by day, with free ventilation. If you do not wish to force them early, they succeed admirably from January onwards in a greenhouse, assigning them light airy positions. After they commence growth liquid manure should be given at every alternate watering, and when in full growth it may be given whenever water is necessary, taking care not to apply it too strong. Until required for placing in heat, the plants should be kept in a cold pit or house with the pots plunged over the rims, and in severe weather afford a protection of mats in addition to the lights.

**CLIPPING CUPRESSUS LAWSONIANA HEDGES IN WINTER (G. G. H.).**—It is not good practice to cut the trees in the winter time, as the relatively slender growths are suddenly exposed to light and cold air, and when the weather becomes severe they are more or less killed or browned, and the hedge or screen has a very browned and disfigured appearance. The worst of it is the browning is very irregular, due to the degrees of hardiness of the plants as influenced by soil, its moisture or dryness, richness or poorness, exposed or sheltered position. It is best to cut the hedge into form in the spring during mild, moist weather, and trim in irregularities in July or August; thus the parts then exposed will be hardened up before winter, and the least danger of browning is provided for. Drought will not make the growths more than naturally brown, but rather stunt the growth, all the better for hedge plants, and the least liability to damage from severe frost is secured.

**EMPLOYMENT IN KEW GARDENS (T. B. W.).**—Young gardeners applying to the Director of the Royal Gardens, Kew, receive a form which has to be filled up and returned. The candidate, if he is suitable, is in due time installed at Kew. At least two years' practical gardening experience is required, and no candidate must be over twenty-five years of age. The form sent from Kew gives particulars, however.

**NURSERYMAN'S TENANCY (W. A. B.).**—You will, on vacating the premises, have a right to remove all your stock-in-trade, your trees, shrubs, and greenhouses; but see that the latter are only screwed on wooden frames, and not built or cemented into brick foundations, and that the boilers and hot water pipes are similarly detachable. We cannot say whether you have the "tenant right" of an agriculturist to compensation for enrichment of the soil. If so, you must have a valuation made before entering. The better plan is to specify all these things in a letter to the landlord. Take a copy of it, and then, if he gives you possession, he will be bound by the terms of the letter.

**SOWING A BANK (M. R. M.).**—In sowing a bank, we presume with grass seeds of different kinds, so as to form a green sward, there are not any small flowering perennials the seed of which can be sown with the seeds of the grasses so as to "create" a flowering bank, unless the different varieties of Clover are so regarded, such as white (*Trifolium repens*) and yellow (*T. minus*), with *Lotus corniculatus minor*. In shady places the best effect we have seen was formed by sowing the bank with grass seeds, and in this dotting bulbs of Winter Aconite, Snowdrops, Crocuses (when fairly open), and Daffodils, the bank being semi-wild, or the grass not cut until the foliage of the Daffodils were fairly died down. For a bank in very shaded spots there is no equal to the Dwarf Periwinkle (*Vinca minor*), of which there is a variegated form, also a white-flowered variety, and others with double white and double blue flowers. The Rose of Sharon (*Hypericum calycinum*) is an excellent dwarf evergreen for shaded places.

**MUSHROOM DEFORMED (J. R.).**—The Mushroom is simply in a monstrous deformed state, and is a form of the Horse Mushroom, *Agaricus arvensis*, evidently the variety *A. a. villaticus*, which attains a very large size, the pileus being sometimes 18in or more broad, and the stem 5in or more in height, and 2in or more in diameter. It is very much larger than any form of the cultivated Mushroom (*Agaricus campestris* var. *hortensis*), and sometimes occurs in Mushroom beds, both outdoor and in Mushroom houses, due no doubt to the spawn; but how the matter occurs is not known. The Mushroom is not only large, but strong smelling and not pleasant, as in the field and cultivated Mushroom. Besides, it is cracked, deformed, and affected by a minute parasitic fungus, which renders it practically useless. The Mushrooms will probably come in fair condition by keeping relatively dry and avoiding damping them overhead while in button state, or even larger. Probably the material of which the bed is made had something to do with the monstrous growth of the Mushrooms.

**MANURE FOR VINES (F. C. C.).**—The pump sewage, diluted, which you give the Vines in the growing season, would be bettered by adding 6lb of superphosphate and 1lb of sulphate of iron to each 100 gallons of the undiluted sewage, mixing well, and leaving for at least twelve hours before using. The Vines may be given a soaking of the sewage now if the soil is in a dry condition, and not more applied than suffices to make the soil evenly moist, as a wet condition at the roots when the Vines are dormant results in soddiness and sourness, and the roots suffer in consequence; shanking frequently results. Where the drainage is good, a liberal application of liquid manure to the border when the Vines are at rest is usually attended with considerable benefit, especially when the Vines have been heavily cropped, or anywise weakly in growth. Cow manure is best used on Vine and Peach borders as a mulch during the growing period, not applying more than an inch or two thickness, and renewing it from time to time, so as to maintain that depth. It is best in a rather lumpy state, and of most value where the soil is light or the border composed of open material. To prevent sourness a light dressing of air-slaked chalk lime may be given in autumn, after clearing off the remains of the mulching, about half a pound per square yard, pointing over the surface lightly, the mulching being given on that. A good artificial manure for Peaches is made by taking one and a half part each of sulphate of potash and sulphate of ammonia, and one part each of superphosphate of lime and steamed bonemeal, mixing well, and applying 4oz of the mixture per square yard in the autumn, pointing over lightly, or it may be applied in the spring, not later than when the buds of the trees commence swelling. As a later dressing a mixture of three parts dissolved bones, two parts nitrate of potash, and one part sulphate of lime may be used, applying 2oz to 4oz of the mixture per square yard, and scratching in lightly. This will probably not be needed until the stoning is near completed, and then applied will help to swell off the fruit.

**NAMES OF PLANTS.**—*Correspondents whose queries are unanswered in the present issue are respectfully requested to consult the following number.* (B. F. T.).—1, *Begonia coccinea*; 2, *B. fuchsoides*; 3, *B. Verschaffelti*; 4, *B. manicata*; 5, *B. Rex* var. (A. C. T.).—*Tenarium fruticosum* and *Abies Menziesi*, the latter assuming your form of it, near the southern coast. (L. F.).—1, *Calanthe Veitchii*. (N.).—1, *Cymbidium Dayanum*; 2, *Luculia gratissima*; 3, *Cypripedium Leeanaum*; 4, *Dendrobium aureum*; 5, *Cymbidium giganteum*; 6, *Nerine flexuosa*. (T. J. R.).—*Iris stylosa*.

**NAMES OF FRUITS.**—*Correspondents whose queries are unanswered in the present issue are respectfully requested to consult the following number.* (G. G. H.).—1, *Belle Dubois*; 2, *Lane's Prince Albert*; 3, *Bramley's Seedling*; 4, *Barchard's Seedling*; 5, *Round Winter Nonsuch*; 6, *Winter Greening*. (H. S.).—1, *Borsdörfer*; 2, *Annie Elizabeth*; 3, *Rambour Frane*. (H. W. Mackereth).—Not recognised; probably a local variety. (S. C. A. H.).—*Dutch Mignonne*. (A. T.).—1, *Peasgood's Nonsuch*; 2, *Emperor Alexander*.

## The Farmer's Poultry.

We are now fast approaching the shortest days—each afternoon finds the lamp lit earlier, and each morning the day breaks with greater reluctance. Not only are the days short, but they are sensibly dreary, cold, and more or less miserable. Mist which degenerates into fog, drizzle that culminates into heavy downpour; hard frost one morning, soaking wet the next, and so on. If there is a time that laying fowls are unprofitable it is now. Many are only just recovering from their season of moult, some are even now only just starting; eggs as a rule are scarce, and consequently dear. The outgoings for food are great, the incomings almost trivial. We are speaking of the masses: not of the classes. We will begin at home. We are cheerful and contented, and the reason is not far to seek—we have eggs.

On or about April 23 we hatched off some white and buff Leghorn chicks, and the first of these, a white, began to lay October 6. The others presently followed suit, and so we go on. Not only are our pullets laying, but some Plymouth Rocks who annoyed us sadly by persistent sitting in the summer, have come into profit now. They were wiser than we. "Why," they argued, "should we be laying when our eggs only make so little? Only average eighteen for 1s. We will rest now and moult early, and then see what we can do in the dull days, and when eggs are selling at seven and eight for 1s." These were self-respecting fowls, and a comfort to their owner.

A friend of ours—of whom some neighbours say she is poultry-mad, and whom others prefer to call poultry-wise—is selling now at this present moment hundreds of eggs per week at the pleasantly high prices. True, she devotes herself entirely to her fowls, and her situation and surroundings are exceptionally good. An isolated farmhouse with heaps of buildings, and surrounded by dry, sandy grass land. We say grass for courtesy, but really it is only rabbit warren, with Whin bushes all over, and full of little dells and sunny hillsides. This friend is guided by two great principles. Her first is not to hatch her chickens too early (that is, her future egg producers), and the second is to feed well and get them forward and healthy without superabundant fat. She has a pan in the oven or a pot on the fire for everlasting, and the great secret is strict personal attention; nothing is left to servants. We may modestly say the same thing ourselves, and we have found that we can combine efficiency with economy in food rations.

It is not the most lavish feeders who meet with the best success. We believe there are stones upon stones of good corn wasted constantly by poultry-keepers who, though they provide the food, quite neglect to supply any apparatus for its mastication. It is part of our regular routine to provide, by means of a hammer and broken crockery, a quantity of conveniently shaped "grit," to make or take the place of internal crop teeth. If poultry owners would give the matter a thought they would easily see that the natural supply of "grit" is soon exhausted in any fowl-run, however extensive (indeed, we might say on grass runs it does not exist), and

therefore it behoves us to make good the lack. We noticed only to-day (how it happened we cannot say) that a fowl or fowls had passed some grains of corn practically in exactly the same state as they had been when eaten. Now, that corn could have done the fowl no good at all. The supply of "grit" must be constant. Why? Because by constant friction the sharp edges get worn away, and the grit is useless. We believe that "experts" allow ten days as the limit of usefulness to a piece of sharp grit.

We have noticed ourselves when opening a fowl, how dull edged have been certain bits of what was very sharp china only a few days before. In some neighbourhoods flint does not exist. It is a splendid masticator, and the supply of best china (broken) sometimes falls rather short. There is no doubt at all that fowls pay for a little meaty food, and our successful poultry friend buys a good deal every week of the butcher in the form of plucks. She does not administer this raw, but well boiled, and then passed through a sausage machine. We are great believers in a liberal supply of vegetables—Carrots and Swedes, boiled or raw. If boiled, they may be mashed down with the paste which forms the morning's meal. Sometimes it is impossible to get much green food, or rather to get enough green food, during the winter months, so these roots eke out the scanty supply. A few well ripened Mangolds afford a pleasant amusement, and keep fowls from moping.

We have said we find the buff and the white Leghorns good layers, and if anyone could tell us a plan by which we could ensure hatching only pullets, we should be most thankful. Leghorn cockerels are poor things; they are too small in frame ever to be built up into good table birds, and if we could only distinguish them when quite young we would gladly sell every young cockerel at the week old.

We have just had a poultry lecturer in this village, and he assures us every well-grown cockerel costs 10s. before it is fit for table! We think he has a little overshot the mark; but there is no doubt of it that many young birds eat off their heads time and time again. The only way to make them pay is to hatch off early in the New Year, feed up quickly, and sell before or at Asparagus time, when there is no game, and only lamb, veal, and duckling to vary the monotony of the rich man's table.

To those of our readers who have incubators and patience, we strongly recommend the early hatching of selling chickens, and the April hatching of chickens intended as stock birds, i.e., layers in October and so forward. The reason the earlier hatches do not make good winter layers is because they begin too early, moult just when you want them most, and don't recover themselves till well into the New Year.

We have spoken about the incubator, which will soon be coming into active service. All our care, skill, and patience lavished upon it will be of little avail unless we use some judgment with respect to the eggs with which it is going to be filled. The birds which are now laying most freely are the pullets, but it is neither wise nor desirable to set their eggs. It is like breeding from immature stock; there will be constitutional delicacy, and winter hatched birds must be as robust as possible. Circumstances are all against them. Then again, it won't do to use the eggs from birds that have been laying continuously for any length of time; their eggs, too, will be lacking in vitality. Sitting and rearing a brood of chickens is a rest to a hen; she has probably been rather better fed, and she comes to her renewed laying well and strong.

Then as to her mate. A fine good cock must be selected, and in winter he will not require to be run with more than four or five hens. One little exhortation about the food. This harvest, alas! has been productive of much damaged grain—some of it so bad, in fact, as to be absolutely useless—yet we fear, and indeed we know, that a great deal of this black, wet, decaying stuff will be set before the poultry of the farm, and they will be expected on it to lay eggs, look well, and do well. This trash may fill them, but be no more beneficial than the rations of clay some savage nations take to quell the pangs of hunger.

We are not very sure about the value of spices and condiments. If given at all it should be with a sparing hand. There is so much food available for poultry that with properly diversified meals the fowl gets change and variety enough. We believe in rearing the strong, not coddling up the delicate. We all know feather beds among the better classes are things of the past; but that does not do away with the fact that there is still a good market for feathers, not only of the best

live goose, but of all other varieties. We are not quite sure whether the farmer, or rather perhaps his wife, takes sufficient account of her feathers' value. If a sheep's fleece is divided into many qualities, so, indeed, may a fowl's feathers if properly graded, well dried, and kept clean. They may represent quite a nice little asset. We wish we could see in every fowlhouse on the floor a layer of peat moss litter or dust, and we wish that it would occur to someone to constantly rake over the droppings, so as to fully amalgamate them with peat moss. At least once a week there should be a fresh sprinkling of the litter. The whole mass would be much easier and nicer to handle, and could be stored in bags or barrels till required. Next to pigeon manure that of hens is most valuable. If we should have soon, as is quite likely, a sharp frost, a little quantity of maize will aid the fowls in keeping up the heat of their bodies, and consequently their spirits.

### Work on the Home Farm.

Wheat has come up very well, and is looking promising. The mild autumn has been so favourable to rapid growth. A drying east wind has put the surface almost into rolling condition. We shall roll the young Wheat, if possible, as it may be months before we have another chance.

The August-sown Cabbage have not grown very quickly, but are quite big enough to transplant. The ground was prepared for their reception some time ago, manure ploughed in, &c., but pressure of other work has diverted attention. If the weather remains mild we shall put a couple of acres in, 15,000 plants per acre, and plant the remainder of the breadth in March. Where ground game is numerous, Cabbage is safer in the seed-bed during the winter; it is more easily protected. But autumn-planted Cabbage produces a much heavier weight of food.

All our regular horsemen having been away holiday-making, the labourers have worked the horses, and a good breadth of fallows has been turned over, but other work has been laid by. Amongst other things, a good deal of attention is required by the fences or hedges. Some of the roadside hedges had been trimmed almost to death for the sake of a neat appearance, and we have let some of them go for two years to strengthen; now they require a strong pruning. In all cases a fair and reasonable fence is required on the side of a public road, and must be provided; so we must keep that in view.

The fence must be taken off low, down to the roots on the side next the sun, i.e., south or east, leaving the brush on the other side about 2ft high or so. If there is a ditch next the road it may be filled with thorns, and a fair guard to the fence will be provided; but if there is no ditch we shall dig a trench and plant a beard of strong thorn branches to act as a protection on the road side. Some, nay, many, people would lay a hedge of this description; but apart from the expense in stakes, we do not like laying, because we think it has a weakening and decaying influence.

We said last week that we should have to wait for the cultivators to plough ley for Potatoes, but we see that a neighbour, who is in the same difficulty, is ploughing with chilled diggers, three horses in each. He says he is ploughing 10in deep, but we think 9in is the maximum depth, and that is quite heavy enough work for three horses. Well! we may be driven to trying the same plan, for we have the ploughs and horses; but we prefer not to kill our horses if we can help it, and shall give the steam cultivator people a little more law.

The milk supply is far from good; the mild autumn and a plethora of grass has tempted us to keep our cows out too late in the season; now we have them up on roots, hay, &c., but the milk flow has been lost and will not return.

Young calves for rearing are rather cheap, and it must be an extra good one to fetch 40s. Had milk been more plentiful we would have bought and reared calves freely, for calves reared from the present time would be just right to put on spring grass or seeds, and would be strong cattle to bring up to the yards next autumn. Those of similar type now in the covered yard have a most profitable appearance, and are really a pleasure to look at.

### A North American State Farm.

An interesting letter descriptive of the Minnesota State Agricultural Farm was recently published in "The Florists' Exchange." The northern line of this State borders the Dominion of Canada for four hundred miles, having on its east Lake Superior and the State of Wisconsin; Iowa on the south; and North and South Dakota on the west.

The State farm is conducted by the University of Minnesota, and is intended to furnish instruction to students in the manifold duties of advanced husbandry, and, second, to assist the

farmers by testing and introducing new varieties of grain and fruits. In connection with other experimental stations and the Department of Agriculture at Washington, D.C., it disseminates new varieties of merit, tests varieties adapted to other sections of the country with a view to proving their adaptability here, and by working along independent lines is constantly improving old varieties and introducing new ones considered worthy of general dissemination throughout the North-west. The farm consists of 260 acres of a rich, deep, heavy loam, which under generous cultivation produces enormous returns.

The work of testing seed varieties, under the supervision of Professor Hays, has been most fruitful of results, and many new varieties of Wheat and forage plants have been added to the list of seedsmen's desiderables by his efforts. Professor Green, in the nursery line, has been equally active, and by careful selection and experiments has added many new names to the list of desirable hardy fruits.

It has generally been supposed that good fruit could not be grown in this State, but the work of Professor Green has proved the fallacy of this supposition, and the many bearing trees of all varieties of fruit prove beyond a doubt that by planting proper sorts and giving them proper attention, Minnesota farmers can have as nice fruit as their more favoured brethren in the Eastern States. In Apples we might name Duchess of Oldenburg, Wealthy, Yellow Transparent, Gideon, Hibernian, Anisin, Peter, Lou, August, Peerless, Wolf River, October, Florence, and many other kinds which thrive here and produce good crops of fine fruit. A race of hardy Apples has been introduced from Russia which seem to resist the intense cold of the State with perfect impunity.

The introduction of the wild Crab stock (*Pyrus baccata*) from Russia, for grafting purposes, has overcome many of the perplexities attending the propagation of Apples in the North Star State. This stock is perfectly hardy wherever tried, of most vigorous growth, and well suited as a stock for grafting. *Pyrus malifolia* is another species from Russia highly spoken of at this station. A large number of seedling Apples is being tested here, the poorer ones being discarded from year to year, and the best propagated, and in time placed upon the market.

A careful record is kept of all budding, grafting, and planting, so that when a new variety is finally placed upon the market its pedigree can be traced back to its inception. In Plums and Cherries the same careful records are kept, and thus the good work goes on. The work not only embraces fruit trees of every description, but small fruits, ornamental trees, shrubs, evergreens, and so forth, all come in for their share of attention. The Rocky Mountain Cherry is found here in fruit, a medium sized oblong, black Cherry, with a fairly good flavour, a vigorous, bushy grower, and an early and abundant bearer. The Compass Cherry, with a medium size plum-like fruit, is also commended. The Buffalo berry, a native of the plains, is a valuable addition to our hardy ornamental shrubs.

Many varieties of Grapes are also perfectly hardy, and produce abundantly, while small fruits, such as Raspberries, Currants, Gooseberries, &c., are hardy and prolific. One plot of ground is devoted to sample hedges—Privet, Buckthorn, Caragana, Lilac, Viburnum, Spiræas, Barberry, &c., properly trimmed. The best all round decorative hedge for this latitude is the Buckthorn, *Rhamnus catharticus*, as it is perfectly hardy, a rapid, dense, and beautiful grower, holding its leaves late in autumn and putting them forth again in the early spring. As far as possible all trees, shrubs, and other subjects are labelled, so that visitors may see and know at a glance what is hardy and what is not.

### Farmers' Visit to Hungary.

We have received a book of 177 pages (5½in by 8½in), entitled "Agricultural Industry and Education in Hungary," this being an account of the visit of the Essex farmers' party to Hungary in May and June, 1902. It is compiled by Mr. T. S. Dymond from notes by members of the party and from official information supplied, with ninety-eight illustrations, all of them very clear and interesting. The work, we believe, is published from the County Technical Laboratories, Chelmsford, at the price of 2s. 6d. The arrangement of the matter is admirable, and the whole journey reads like a very interesting letter, and one cannot but be impressed by the care that the compiler has taken to gain every point of information that is likely to be of service to farmers in these Isles. Horse breeding being a chief industry in Hungary, much prominence is given to it in this book. Pigs, cattle, sheep, and poultry also receive due attention. The Hungarian Government did everything that lay in their power to make the journey both useful and pleasant, providing saloon trains for the party, and on more than one occasion invited them to State hospitality. Private Hungarian gentlemen whose farms were visited were also exceedingly courteous. Save for an accident to one of the party, owing to the bad roads, the visit was one of the most successful the Essex farmers have yet undertaken. We think highly of the volume, and commend the spirit that led to its production.

## ORNAMENTAL TREES AND SHRUBS.

**S**TURDY, well-matured growth, and a sufficiency of fibrous roots, are two cardinal points that are always kept in view by planters when making selections of trees, shrubs, &c. To these points (with others) we give special attention in our cultivation of these subjects. We invite special attention to the following as containing the choicest and best varieties in strong, healthy, well-rooted and well-balanced plants.

### TREES (Ornamental).

|   |    |      |      |
|---|----|------|------|
| 12 choice distinct sorts                                | .. | 12/- | 18/- |
| 50, in 25 choice kinds ..                               | .. | 40/- | 50/- |
| 6 choice and distinct weeping Trees ..                  | .. | 9/-  | 15/- |
| 9 do. do. do. ..  | .. | 12/6 | 18/6 |
| 6 do. do. Avenue Trees, specially grown and selected .. | .. | 12/- | 18/- |
| 12 do. do. do. ..                                       | .. | 24/- | 36/- |

### SHRUBS (Ornamental).

|                                 |         |       |
|---------------------------------|---------|-------|
| 6 lovely Evergreens, in 6 sorts | 4/6 to  | 12/-  |
| 12 do. do. 12 sorts             | 9/- to  | 24/-  |
| 50 do. do. 25 sorts             | 42/- to | 100/- |

### Old-time Gardening.

(Continued from page 447.)

ONE might build theories on the essay "On Gardens" by Bacon; but it will be better to trust to more sober writers, from whom we gather that English gardening in the last year of Elizabeth was in a less splendid condition, though, on that account, no doubt on a more sure footing. All about London, for instance, were fields devoted to vegetable culture for the supply of the metropolis, others in which quantities of Roses, Clove Gilliflowers, and other plants were cultivated for medicinal purposes and for sale to the lieges for their private uses.

Among market growers who paid as much as £6 an acre for land, the question of manuring was assuming proportions that called for something further than that supplied by the lay-stalls of London streets, and so we find saltpetre, soot, rags, bones, and many other kinds of material being used as manure. The employment of vegetables among the working classes was becoming more and more common, and we gather from a later writer that at this period few, if any, cottages in the South of England were without gardens attached. In the western counties, Carrots and Turnips were used instead of bread, the value of Potatoes being as yet unrecognised. Farmers are said to have been further in the rear as regards gardening than any other class. The dwellers in towns and cities who could not afford gardens in the suburbs making up to some extent the want by cultivating flowers in boxes and pots. At this period the first really English work on fruit culture appeared, the production of a Yorkshire gentleman, and which shows a remarkable state of progress in the northern counties. An interesting fact is noted in this book, "The New Orchard," to

READERS are requested to send notices of Gardening Appointments or Notes of Horticultural Interest, intimations of Meetings, Queries, and all Articles for Publication, officially to "THE EDITOR," at 12, Mitre Court Chambers, Fleet Street, London, E.C., and to no other person and to no other address.

the effect that gardeners formed a part of the establishment of country gentlemen. The gardener had charge of trees, as well as subjects more closely connected with his calling, and he was also bee-master. Whatever beyond what was required for the use of the proprietor and his family, it would appear, went to the gardener, not as a right, however, but as a mark of appreciation. Lawson's charming book depicts the orchard and garden of his day as a very delightful appendage to the house, the chief windows of which looked out on its flowers and fruits. "The Fruiterers' Secrets," a small pamphlet, shows how far advanced some, at least, of these old-time worthies were in the matter of gathering, preserving, and packing for transmission from one place to another the various fruits then in cultivation. It is the simple truth that in some things we know no more now than was published then. At this time a garden, no doubt a small one, was attached to every gentleman's house throughout the country; nurserymen were established where fruit trees, seeds, &c., could be purchased.

It was about this time that John Tradescant, then gardener to the Earl of Salisbury, made a tour of the Continent in order to purchase the best productions of these countries. He introduced many kinds of fruits and also flowers—the double Stock, for example. Tradescant was the first *gardener* who assumed the rôle of introducer, and it may be said with at least a degree of truth that he did much to separate the calling of the gardener from that of the physician, as the latter at an earlier date had taken the place of the lay monk.

I think it is not unlikely, too, that the florist pure and simple became part of the body politic at this period. It is clear from what Parkinson states, that the cultivation of certain flowers, which had nothing but their beauty to recommend them, or which were cultivated solely for their beauty, had already when he wrote become crystallised into a section, and several names have descended to posterity as cultivators of Carnations, Tulips, Auriculas, Anemones, and such-like. The florist of the seventeenth century had a whole-hearted contempt for persons who cultivated any other flowers than those he had marked as Flora's choicest; he occupied a niche of his own, and would allow it to be decorated after his own fashion only.

At the time we take leave of the old-time garden it contained almost all the vegetables we now cultivate, and a few more. Parsley was cultivated for its roots as well as its leaves. The use of Nettle tops, *Apium graveolens* or Smallache, Leeks, the leaves only, and Skirrits still continued. Violet flowers, Strawberry leaves, and some others used in pottage were beginning to cease to be used. Celery, "Sweet Parsley" it was called, was brought from Venice and cultivated in London. Potatoes were only a curiosity; but they had no Broccoli as yet, no Scarlet Runners, Kidney Beans taking their place, and were trained to stakes, and, as would appear, used ripe, more as Haricots, than as we use them now, green.

Among tender plants, we may be certain that the Orange had commenced its long career. It was at first planted against walls, and was protected by means of boards during the winter. Later this was supplemented by glowing charcoal introduced during frost. There were as yet no greenhouses. Melons, Musk Melons as they were called, were cultivated, the necessary heat being produced by heated horse manure and litter, or by means of Barley straw, which was said to keep its heat longer. There was no glass to place over the plants, but they were covered with mats and with oiled paper laid on cross sticks. Though we find these details, it is certain that they were a crop that was difficult to succeed with, and very few attempted their cultivation.

At this period the first mention occurs of syringing trees, which was effected by what is called a "Dutch Engine." It was carried by two men, and is said to have been effective for the purpose for which it was used. Shortly after this date we discover the ordinary watering-pot, with rose, which was made removeable as now; but it is doubtful if the water-pot in use at the beginning of the century was other than the old-fashioned one with a wide bottom pierced with holes, which narrowed to the top, where the orifice could be stopped with the thumb. It was filled by dipping the vessel into water, and when full the thumb was used to stop the upper hole; when in use the thumb was removed, and the water was sprinkled automatically over the plants to be watered. We learn, moreover, of the use of manure-water for the first time; it was applied in a very simple manner. The vessel containing the liquor was placed close to the plant to be fed, to which it was conveyed by means of a piece of rag, one end of which was soaked in the liquor and the other laid close to the base of the plant, a slow, but doubtless a sure process, as we read of large Strawberries being produced by this means. The early gardener had a wholesome

dread of manure-water or manure in any form "burning" his plants, hence, no doubt, the care bestowed in its application. These as a whole may seem poor advances, but they meant much in those days, and are really the precursors of the better means we have at hand now.—B.

[In the instalment preceding this *Staphylea colchica* should be *S. pinnata*.]

## Unsatisfactory Vines.

During recent years questions of economy have had to be seriously considered in connection with the management of hosts of gardens, and in some of them such considerations have induced cultivators to plant Vines in the natural soil where this has been fairly suitable, instead of incurring the expense of borders made in the orthodox way. Such cultivators have often been able to point to fine results achieved under this simple system of trenching the soil deeply, and adding bonemeal and horse droppings before planting. Well, the truth of the matter is that when Vines are grown to produce bunches of a suitable size for table, they will often thrive remarkably well for a time under what may be termed rough-and-ready kind of treatment, and when decadence begins some cultivators seem somewhat puzzled. There should, however, not be much mystery about the matter, as the fault invariably lies at the roots. Vines have a natural tendency to produce long rambling shoots, and the roots possess similar characteristics. Even when good borders have been made, unless they are constructed piecemeal, the roots quickly run through the soil and exhaust much of its fertility. Then the older portions of the roots decay, and the soil gets sour. Partially lifting the Vines and relaying the roots in fresh soil is the remedy in such cases.

In those instances in which proper borders have not been made, the roots follow their natural bent, and ramble in all directions, sometimes going down to a cold clay subsoil, at others pushing through poor and unsuitable materials nearer the surface. A good method of dealing with such ramblers is to take out a deep trench 6 or 8 ft from the point where the Vines were planted, cut off all roots found, place some concrete or rough rubble in the bottom of the trench, and build a wall to confine the roots within.

In those instances in which the borders were originally well made and the roots confined to the border, a somewhat different method of procedure should be practised. Take out a trench at the front, quite down to the drainage, then gradually work out the soil from between the roots, and clear it away up to within 2 or 3 ft of the Vine stems. As the work proceeds, the liberated roots can be tied to stakes and covered with mats to prevent them from getting very dry. It is always wise to have plenty of hands employed on work of this description, so as to get it done quickly. As soon as the intended amount of soil has been removed, re-arrange the drainage, and fill in the border with fresh soil, placing a layer of roots about 1 foot from the bottom, but bringing the bulk of them to within a foot of the surface.

Of course all damaged roots should be cut away, and the ends of the others also removed. When this is completed, a few inches of the surface soil of the hitherto undisturbed part of the border should be removed, and fresh soil added, the whole surface of the border being then dressed with a 6 in layer of sweet, fresh manure or half-decayed leaves.

Some cultivators in renovating Vines lift them completely out of the old soil and entirely remake the border. Under careful management, when the Vines are not very old, this often answers well; but it is not a practice which can be generally recommended, as I have seen instances in which it would have been far more satisfactory to plant young Vines than spend so much labour on old ones which were a year or two in recovering from the effect of such drastic measures.

To keep Vines successfully year after year it is necessary to be continually doing something to the roots, instead of neglecting them for years, and then doing too much at once. The following compost is one which I have used frequently in renovating Vine borders, with the best results. Good fibrous loam, eight parts; fresh horse droppings, one part; burnt refuse, one part; lime, half part; soot, half part; bonemeal, half part; turn the whole two or three times before use. In dealing with Vines which have long spurs it is an excellent plan to leave three or four eyes on each spur at pruning time, and select the strongest shoot from each at disbudding time. If a young rod is also taken up between each old one, the extra growth produced will do much to promote vigorous root action, and the old rods can be partially or entirely cut away the following year.—H. D.

**Cypripedium insigne, Harefield Hall variety.**

The number of new *Cypripediums* is almost as great now as the yearly number of new *Chrysanthemums*, and the enhanced beauty of the present-day forms in comparison with the type plants is striking. Some are remarkable for distinctness of colour, while many combine size with other attractive points. Coming within this latter category is the one we depict to-day. At the last two meetings of the Royal Horticultural Society, in the Drill Hall, large numbers of well-flowered plants of the Harefield Hall variety of *C. insigne* have been exhibited from many different cultivators. The variety possesses bold flowers of the size here given, and these are carried on stout footstalks. The most attractive organ is the dorsal sepal, it being quite 3 inches across the centre. The middle portion is pale green, heavily spotted with chocolate, and all round the outer margin there is a broad white edging. The pouch and petals are yellowish green with veins of darker green, and suffusions of brown. It is a most commendable and robust *Cypripedium*, and was certificated (F.C.C.) in December, 1898, when staged by E. Ashworth, Esq., of Harefield Hall, Wilmslow.

**Orchids at Highbury in November.**

When on a recent visit to the neighbourhood of the home of the illustrious Colonial Secretary, advantage was seized upon by the scribe to accept an invitation by Mr. John Mackay, the grower, to inspect the Orchids under his charge. The visitor found his courteous cicerone engaged in packing one or two flowers of a new hybrid, by name of *Brasso-Cattleya Marisæ* (*C. Warneri* × *B. Digbyana*), for transmission to the meeting of the Royal Horticultural Society on the following day. The bigener was raised at Highbury, and the blooms in question were the first produced, and appeared to possess distinctive merits, its large proportions being suffused with a delicate blush pink, and a bright, dense purple spot on the labellum, which latter partook of the *Digbyana* fringe, the disk having a greenish-yellow hue. Since the writer's previous visit several months ago, a remarkable improvement was noticed amongst the Orchids throughout, and in numerous cases the growths were of astonishing proportions. As there is almost always a large demand for cut Orchids at Highbury, it might occasion the visitor some surprise to find that probably a comparatively smaller complement of plants in flower at any one time than might be seen in collections of a similar extensive character. The show house, however, at the time of the writer's visit, was resplendent with a numerous variety of Orchids, principally *Cattleya labiata* in variety and *Lælio-Cattleyas*.

Among the latter a vigorous specimen of *Statteriana* was noted, with a profusion of blooms at least 8 inches across, its rosy-purple sepals and petals, and the lip of a rich crimson-purple colour, presenting, as it did, a striking object amongst its compeers. In close proximity was observed a thriving piece of *C. Mantini grandi-*

flora (*C. Bowringiana* × *C. Dowiana*); it is a great acquisition, with its deep purple lip, and petals and sepals of a much lighter shade.

Another equally attractive *Cattleya* was Miss Williams, raised from *Harrisoniæ* and *Gaskelliana*, with three spikes, carrying eighteen blooms collectively, produced from the current year's growth of pseudo-bulbs. The shape and colour savour more of the prior mentioned parent than the latter. A nice piece of *Sophro-Cattleya Chamberlainiana* var. *triumphans* was represented with four vigorous growths, carrying a complement of five flowers, each about 4in across.

Noteworthy, too, was a neat bit of *Lælio-Cattleya Decia* (*L.-C. Perrini* × *C. Dowiana aurea*) possessing a vigorous spike with several very showy flowers. An attractive object should be a flourishing piece of *C. labiata autumnalis*, with three robust spikes of yet unexpanded blooms. A similar remark may also apply to a fine specimen of *C. Bowringiana*, with seven or eight vigorous spikes of as yet unexpanded flowers. In the same category may be mentioned a healthy and vigorous plant of *Vanda cœrulea*, bearing eight or nine spikes expanded and expanding flowers. Very beautiful, too, was a nice specimen of the Indian *Crocus* (*Pleione lagenaria*), bearing numerous extremely interesting and pretty flowers. A piece of *Cattleya maxima* was distinguished by several fine flowers, with their purple veinings in the lip. Enhancing the display were several representatives of *Oncidium* *Forbesi* and *tigrinum splendens*, with their elongated spikes of large showy flowers. A plant of *O. ornithorhynchum* likewise lent lustre to the scene.

Of *Dendrobies*, *D. Phalanopsis highburyensis* was conspicuous by its richly hued flowers. *D. formosum Lowi* was noted, in company with a good piece of *Barkeria* (*Epidendrum*) *Lindleyana*. A very strong and healthy piece of *Angræcum sesquipedale* was remarked with two or three vigorous spikes of unexpanded blooms. In a separate structure a large batch of the almost indispensable *Lælia aneeps*, bearing hundreds of spikes of unexpanded embryo flowers.

The foregoing are a few of the more interesting and conspicuous kinds of Orchids noticed at the time indicated. Interesting and instructive, too, was Mr. Mackay's series of experiments with different media for potting purposes, and of which English leaf mould forms a favourite agent, especially for the production of vigorous young plants or others requiring a fillip to push them along. The benefit of this much discussed and popular becoming agent was well demonstrated by the fine roots of numerous young plants of terrestrial Orchids at Highbury. Otherwise peat and sphagnum continue to form the stable medium for established plants at Highbury. At the conclusion of an enjoyable, but all too brief a visit, and when the shades of eventide began to prevail, the scenic effect of the show house was much enhanced by the flood of electric light switched on at the doorway, a provision attached to the rest of the glass structures—at least, those of principal importance; and then, after reciprocal hearty adieus with the genial orchidist, I hastened to

**Cypripedium insigne, Harefield Hall variety.**

view another floral scene—that in the Birmingham Town Hall, in connection with the occasion of the grand festival given in honour of Mr. Chamberlain's intending visit to South Africa. The elaborately decorated galleries and the richly embellished dinner-tables, combined with the arrival of the expectant guests awaiting the presence of Mr. and Mrs. Chamberlain, afforded a *tout ensemble* of beauty and grandeur not readily erased from the memory of he who had to be content to participate, albeit in an ocular instead of a gastronomic demonstration.—W. G.

### The Week's Cultural Notes.

In many collections the blinds used for shading in summer are left up and used for covering the glass during sharp spells of frost. Covering is an excellent protection, a couple of thicknesses of canvas or tiffany keeping out a lot of frost and preventing the need of sharp firing, and this is the reason for leaving the blinds in position. But often in frosty weather the pulleys and ropes get tightly frozen after the blinds are let down, and, in consequence, the latter cannot be raised in the morning, but remain on the glass, keeping out the sun and light for hours.

This is the one reason for not recommending their use for winter as well as summer, for there is a vast difference in the feel of a house that has been covered all night and one where hard firing has been resorted to when you enter it in the morning. But the days are all too short now, and it will not do to shut out what little sun we get; consequently, some other method of covering has to be resorted to. On the roofs of small houses garden mats answer well, or a piece of the white garden netting nailed at each end to a roller, and laid on every night and rolled up in the morning.

The *Dendrobiums* are already starting their flower buds, the nodes on *D. Wardianum* being already prominent. Forcing is not usually necessary or advisable, but there are some species that may be hastened when required. *D. nobile*, for instance, may be placed in strong heat after its winter's rest, and if not kept too moist flowers will be produced in a month or thereabout. In the presence of strong heat and moisture the flower buds are conspicuously absent, and growth buds take their place.

*D. aureum* is also one of the first to show flower, and may often be seen at Christmas. I never keep this species very cool in winter, as I find that after the rest the pseudo-bulbs are apt to decay at the base. *D. crassinode*, again, has the same habit, the base of the stems being very slender in comparison with the swollen and thickened upper portion. All these deciduous species must be kept dry still at the roots. Well ripened plants have plenty of substance in them, and can easily keep going. Even should the bulbs shrivel a little no harm will be done, as they will soon freshen up when water is applied and the growing season again commences.—H. R. R.

### Orchid Hunting.

A gentleman, just returned from Colombia, where he has been Orchid hunting in the difficult mountain region, has given an interesting account of how the precious plants are obtained. He says that the mountains are most difficult to ascend. To reach an altitude of 9,000ft or 10,000ft is in itself a day's work. Here, as in plain and plateau, there is true forest growth—dense brushwood next Palms and Fern trees, and then, towering above these to 100ft or more, huge forest trees. A road is cut into the interior—often a long and tedious process—and eventually an encampment or central receiving depot is made. The party is divided into sections, and each has a particular area to explore—generally sufficient work to occupy a week. They are well fortified with axes and guns, and carry big baskets, made of dried leaves, in which to put the plants. The result of the search is largely a matter of luck. In a good district each man's findings will average from eighty to one hundred plants weekly. They are of all kinds, but largely *Odontoglossums* and *Cattleyas*, and are on the branches of the tallest trees. It is next to impossible to say from below whether they exist above the timber line. They cannot be seen, but the natives are said to possess a remarkable instinct in being able to say where the flower is likely to be found. They seem to recognise the type of tree mostly favoured by the plant, and it is seldom that their calculations are at fault. The plants are immediately stripped of their leaves and the bulbs dried. These are then fastened separately on cross-pieces of wood in large well-ventilated cases, and sent to the coast town for shipment. The bulbs, on arrival, look withered and unsightly, not unlike dried sticks without any value.

### Carnation Mrs. T. W. Lawson.

When this Carnation first came over from America there were some who said it had been boomed too much, and others who, on seeing the first flowers open, felt more than disappointed, as they were small and insignificant, and of a washy colour. This was only to be wondered at, considering the tremendous amount of orders sent to America when it was announced for distribution, consequently the rapid rate of propagation had a most serious effect on the constitution of the plants. Now that we have mastered its requirements, we can value it in its true light. Quite by itself in its lovely shade of colour, it has also splendid long stems, and lasts long when cut. The Liverpool florists' windows have certainly contained nothing more beautiful. It is a good grower, and if one only takes the precaution to shade from strong sunshine the colour is intense and attractive.—R. P. R.

### Result of Shows.

As was to be expected with an unfavourable summer and a late autumn, the early shows suffered somewhat in point of quality and quantity of exhibits. I predicted the midseason meetings and the later shows to get the best support and the finest exhibits, and so it turned out. Almost any show held during the second or third week of the show season was the better supplied with good material. No matter how skilful the cultivator, without favourable weather it is not possible to obtain desirable results in *Chrysanthemum* culture; still, on the other hand, knowledge, care, attention, and energy to push such attributes will do much to overcome what others may look upon as obstacles of an insuperable character. This is a season when all attention to minute items has stood growers in stead, and should be a lesson for those of less experience not to ignore all apparently to them too minute details in culture.

Speaking broadly, the season now brought to a close has not produced anything of a sensational character, either in exhibits or new varieties, yet, on the other hand, we have had average quality and certainly numbers, and not a few new exhibitors. Here and there shows have exceeded former years in point of quality of their exhibits, notably Sheffield and York, which, of course, to these societies is very encouraging. Speaking generally, there has been a much superior display of incurved blooms than was at one time expected. This section is not yet as near its death's door as some would have us believe. As is usually the case, there has been even a greater tendency to stage blooms of enormous size in preference to those of less dimensions but more in keeping with the ideal of an incurved flower.

At northern shows this has been more apparent than in the south of England. Cultivators there pay more attention to mere size than individual form. This, I think, has been an undisputed fact for the last twenty-five years; certainly my experience of shows in all parts of the United Kingdom gives no other opportunity but to express this opinion. Cultivators are not entirely to blame for this, what I call a defect, in placing size before quality. If the powers that be will admit these mongrel bred varieties into what should be a more select list, then exhibitors have the right to include such, although it is not always to their advantage to do so. Some exhibitors of incurved blooms do not pay sufficient attention to preparing them, not only on the show day, but previously; the consequence is many more "rough" blooms are to be seen. This is to be accounted for by the fact that less general interest is taken in this section than formerly.

Staging undressed blooms may coincide with the views of those who are not exhibitors, but if this section is to be retained in the exhibition building let us have them as near perfection as it is possible. The form of a globe is the ideal in an incurved flower to aim at.

The difficulty exhibitors find nowadays is to get young men to take an interest in preparing the blooms of incurved varieties, and thus we see so many immature specimens. If beginners would copy the standard of a Higgs, a Mease, a Hunt, a Crooks, a Neville, or a Goodacre, we should quickly find a general improvement in the blooms presented, and an increasing desire for their retention in the prize schedules, and a general wish for an extension of this section in other methods of production.

Japanese varieties have, of course, been the more numerous; the competition in many instances has been unusually severe. In some classes from ten to fifteen competitors have taken part, which is a strong proof of the popularity of this section. I have noticed a greater tendency throughout to select blooms more for their all-round quality than merely for size in diameter, greater depth of individual flowers with fulness in the centre, and a deeper regard for freshness and quality of petal has appeared to be the aim more of exhibitors—points of excellence that would commend themselves to all true lovers of an exhibition *Chrysanthemum*. The reflexed, semi-drooping style of flower which displays so much more of its surface colour, has been the aim. Surely this is a step in the right direction. What we require is flowers of a pronounced character, those that are neither distinctly incurved nor the opposite have not the same individual charm as those that are typical examples of reflexed or incurving varieties.

I notice a much greater tendency to manipulate the petals,

even of Japanese varieties, than formerly, with a view, of course, to display brilliancy of colouring, which is partly hidden in some varieties under various forms of culture. For instance, W. R. Church, Mrs. Barkley, Mrs. G. Mileham, Pride of Madford, and sundry others have been assiduously operated upon by the dexterous manipulator, and not always with disadvantage to himself in close competition. Those who are not exhibitors, and who have no connection with such beyond that of an admirer of Chrysanthemums, generally condemn the practice of "turning" the petals. Whether the habit of making the most of a flower by such a method is to continue remains to be seen, but certainly we get a much brighter-looking stand of blooms than formerly.

Better methods of staging the blooms upon the orthodox stands have been more general. Exhibitors appear to realise that a medium height of raising the blooms is more conducive to perfection than setting them either too high or too low. All round deeper inquiries are made for vase classes. Even those societies who have not yet adopted this principle of staging large Japanese blooms are inquiring how they look and where suitable vases are to be obtained, which is a sign of the times that they too must shortly adopt the method, even if it be but in a small way at the start. There is no doubt whatever but that in the near future every society, large or small, will insert one or more vase classes in their schedule, and rightly so.

The present has been a bad season for Anemone, reflexed, and pompon varieties. I have seen but one instance of a meritorious stand of the former—that at Manchester. Even the single-flowered varieties and what are known as decorative Japanese, like Source d'Or, Elaine, and many others, have been sparsely contributed. In the last two instances the season is accountable for much of their barrenness. In the former three sections, I fear, a loss of interest has much to do with the falling off in the number and quality of the exhibits. It does seem a little strange that those known as decorative kinds have been so limited when we never had a better display of what are known as "border" Chrysanthemums in the open. Even now many varieties are quite creditable to look upon after 8deg frost having passed over them.

Briefly summing up the result of the season, I cannot but say it has been quite satisfactory taking all things into consideration. There has been no jarring notes heard, and but few causes for dissatisfaction. On the whole, I regard it as a good season, weather taken into consideration.—E. MOLYNEUX.

#### The Height in Growth of Some Novelties.

Mr. G. Foster asks, on page 519, to what height Chrys. S. T. Wright will grow. When stopped and second crown are secured, the height from pot to flowers measured exactly 5ft with us. Mrs. C. J. Salter is only 5½ft this year, and last year it was 5ft. Mr. Foster says that the varieties Henry Barnes, T. Humphreys, and Mrs. C. J. Salter were catalogued as growing 5½ft, but certainly this was not by us. I should prefer Mr. Foster to call at Earlswood and see the collection, because it is not fair to measure such flowers as Mrs. T. W. Pockett, which Mr. Godfrey had at the Aquarium Show, for instance, by the side of those which Mr. Pulling had in his first prize vase, not six yards from them; or those which we have shown at the Royal Horticultural Society's shows. We have plants of Henry Barnes this year quite 10ft high. I have had Vicar of Leatherhead 11ft, Mafeking Hero 10ft, and Australie would go quite 12ft this year if left to natural second crown buds or terminals. Mr. Calvat's new Madame Waldeck-Rousseau was a foot taller than Australie. But, at the same time, Lord Alverstone was only 4ft, and Mr. Godfrey says this is the best Mum Mr. Pockett has ever raised. Mr. Foster could not have seen this. Lastly, let me add, in reference to "Viator's" notes on pages 518 and 519, that Durban's Pride is not an American variety at all (as per his report of the Exmouth collection), but one which I got from Australia and distributed last spring (not one of Mr. Pockett's varieties), but raised by Mr. Durban, of Tasmania.—W. WELLS, Earlswood, Surrey.

#### Culture of Japanese Varieties.

If we wish to grow the Japanese Chrysanthemums as bush plants, the general treatment will not differ from that accorded to incurved, Anemone, pompon, or reflexed and other kinds of Chrysanthemums; but, if we wish to produce large blooms, the procedure is somewhat different. Chrysanthemums as a class are cultivated in numerous ways—as bush plants, dwarf trained, small plants in "32" and "48" pots, cut-down plants, and others solely for large blooms. We will take first the plant that is required to produce large blooms fit for exhibiting. In order to start well, strong cuttings should be inserted by the end of November or early in December. They should be placed singly in small pots (thumbs), three or four in a larger pot, or in a bed prepared for them. An intermediate temperature should be maintained, and they may be kept quite close until they have rooted. Air should then be admitted, slightly at first, but more freely as the plants become stronger. When the cuttings are

well rooted, they should be potted into small and large "60" pots, and, if possible, they should then be put into a frame where they can be kept rather close for a few days, so that no check takes place.

After a start has been made—weather permitting—the amount of air should be gradually increased, and when well established the lights should be removed altogether on fine days. The next shift required will be from the large 60's (3in) to 32's (5in), and from the small 60's to 48's. The plants should be replaced in the frame, kept close until they have recovered from the shift, and then be given all the air possible. I do not consider it safe to place the plants outside until the middle of May. The position chosen for them should be as sunny as possible and, at the same time, be sheltered from cold winds. Plants removed from the protection of a frame and suddenly exposed to cold winds, suffer a great deal, and often lose many of their leaves.

All plants should now be staked, not finally, but with a stick sufficiently long to prevent them being broken off by the wind or by birds. During the month of June the plants will require their final potting. The pots generally used are 16in and 12in, or 8in and 10in, and the plants should be potted very firmly.—G. CARPENTER.

## Notes on Apples.

Mr. L. Castle told me some years since that experience would show that Apples vary much in all respects from climate and soil. He foretold correctly. I don't think I have missed reading one issue of the Journal since 1875. I have observed your practice is to be liberal to all of us with your space, yet it is not often that culturists relate results not concordant with accepted generalities. Few of us to-day care for unclassified facts. We assume they are facts; but life in a garden leads to what we call variations in the things we observe. Hence we are, and ever will be, empirical. How advisable, therefore, to collect all the "experiments" or "variations" we can. Everyone can do a little. I send you Apples Mère de Ménage, Flanders Pippin, and Belle de Pontoise. They are not of the "select" lists, but they are good. The trees and fruits have much in common. They grow freely, with shoots far apart, are fair fruiting, and the Apples of good size. Cut out cross branches, but let the others alone; same pruning suits such as Tower of Glamis and Brabant de Bellefleur. No Apple trees sooner show a lack of phosphates than these. Mère de Ménage is slow to fruit, earlier on Paradise. Along the east coast it does well; in the Midlands it cracks, casts, cankers, and commits all manner of wrongs. Flanders Pippin is not in fashion; its home is in Worcester and Hereford. It is preferable to Mère de Ménage, because it keeps longer, is nicer in shape, and the tree bears earlier. The Non-such stock does not thrive in many districts; it does here. Flanders Pippin grafted upon it is successful. Probably few have thus experimented, but a trial by the many is advisable, for of all cooked Apples none exceeds in digestibility with aged persons this and Betty Geeson. This may seem a petty remark; it is made because many private gardeners can increase the estimation with their employers when they supply them with fruit they like and can digest. Such men as Mr. W. Crump and Mr. W. Coleman knew this.

Belle de Pontoise has not met with the approval it deserves. It grows and fruits well here. Mr. Francis Rivers got it from France, and distributed it shortly before he made his cooking tests, which were related in the Journal, February 25, 1892. Cockle's Pippin is worthless here—no juice, no aroma. It does not improve with late keeping, as I expected it would do. To-day, December 1, I pulled from a bush tree, and ate, the American Apple Jonathan, which I had purposely left. It was luscious. I ate another in the store, but it was not so grateful to the palate. My inferences from Jonathan are that some Apples will improve if left on the tree until almost winter, that often it is fallacious to say the quality is not so good in the north as in the south. Ament this, I instance the Melon Apple. I have it on a wall, and as a low bush. The latter produces the best fruit freely; the former is a sad victim to scale. If you want a soft, melting flesh, rich with aroma, and a very digestible dessert fruit, then grow the Melon Apple. It is deficient in phloem in the fruit stalk. It has ripened this year, and Cox's Pomona has not. Whilst I am on eating Apples, which are excellent and can be well grown on and near a line drawn eastwards from Cheshire, I must not leave out James Grieve. I cannot write too much in its praise. It is especially useful in small gardens.

I am of opinion that when dessert Apples, which are digestible, soft fleshed, juicy, and rich in aromatic flavour, are wanted from July to January, the best are Irish Peach, Lady Sudeley, James Grieve, Melon, and Cox's Orange Pippin.—R. C. APPLETON, F.L.S., Beverley, East Yorks.

## Gadding and Gathering.

"HERE AWA', THERE AWA'."

The firm of Messrs. Robert Veitch and Son, of Exeter, Devon, command a wide respect and *clientele*, throughout the southern-most counties of England especially. A visit to their several nurseries reveals the fact that, though trees, shrubs, and hardy plants demand and receive the greater part of the firm's attention, yet all branches of the nursery trade is fostered, and the patron of Orchid collections, equally with the purchaser of ornamental stove and greenhouse plants, may discover the object of his quest at the chief department of this firm, in Exeter town. The nurseries on the New North Road are both beautifully and healthfully situated on rising ground, that gently slopes to the southern sun, and on the higher divisions of this ground are the glass houses. The occupants of these need not detain us until the outdoor department, with its trees and shrubs, have been discussed.

### Trees and Shrubs at Exeter.

If, after the many earnest pleadings that have unintermittently been made for the more extensive planting of choicer shrubs, and if, after the capable and lucid instructions that have voluminously poured from the gardening press, there is not a great renaissance soon to be recorded along this line, then British horticulture is erroneously eulogised. But the renaissance has undoubtedly begun; the keen observer has many proofs, and it will certainly expand. There is a delightful representation of the most beautiful and handsome shrubs in English nurseries waiting to be ordered; why, then, is a use not found for them?

The highly developed colour of the shrubs at Exeter could not be overlooked, and some beautifully feathered pyramidal bushes of *Cryptomeria elegans* had assumed quite a purple-chocolate hue. Conifers, more livid green than *Cupressus erecta viridis*, covering whole brakes, would be difficult to imagine or find. Messrs. R. Veitch and Son have nearly all of the newest Japanese shrubs, and, naturally, where the climate is so moderate even in the winter, the Bamboo element forms a somewhat conspicuous part. The beautiful *Phyllostachys flexuosa*, which is also one of the best in the Bamboo garden at Kew, was pointed to with pride, and this graceful representation of leaf and stem—one hardly cares to call Bamboos "shrubs"—is, we are told, becoming more largely planted each year. The robust growing *P. viridi-glaucens*, and which is at the same time one of the hardiest and least exacting in its requirements, together with *P. Henonis*, another rampant grower when established, require abundance of space in which to develop. They are beautiful subjects for a sheltered dell. Then there are *Phyllostachys aurea*, with slender, brownish-yellow stems, a most delightful shrub when it gets to 10ft or 12ft in height, and as much or more through. *P. nigra* has long, narrow leaves and black stems, and is also quite hardy. Some of the *Arundinarias* were also seen in a state of rude health, such as the noble *A. Simoni*, with plume-like drooping clusters of twiggy growths, and leaves attached on comparatively slender rod-like stems; *A. nitida*, a fine growing form; *A. japonica* (*Bambusa Metake*), the best known of all the hardy Bamboos, and one of the boldest and handsomest; with *Bambusa palmata*, and *B. tessellata*, both broad-leaved species, and dwarf in growth, are undoubtedly amongst the most commendable foliage subjects the planter could utilise. A Bamboo garden may become a feature of many more estates as time wears on. This section of outdoor vegetation is best grouped together in the manner of *Rhododendron* or Rose dells, though, in association with them, it is quite admissible to employ *Yuccas*, *Pampas Grass*, *Miscanthus*, and certain trailers or lowly-growing things—*Smilax rotundifolia*, Japanese golden reticulated *Honeysuckle*, *Gaultherias*, and *Funkias*.

*Nandina domestica* has been more frequently brought to notice through the pages of this Journal than of any of its contemporaries, and it is, therefore, unnecessary now to repeat the story of its graces. "Down south" it is perfectly hardy, and I have even seen it flourishing out of doors near the Haddingtonshire coast. Its chief merit is a light elegance of growth. At Exeter, Messrs. Veitch have some plants of it in pots, so that these can be planted at any season of the year. Then there are the different *Arbutus*, which, though not graceful by any means, are exceedingly interesting shrubs. On light, dry banks in the North Countree they seem to succeed, but they like comparative shelter and a cool soil, inclined to be fibrous or peaty. The red-flowered *Arbutus* (*A. Unedo rubra*) furnishes a splendid addition to the grounds in those parts, where it flowers abundantly. The red-brown bark of the Strawberry tree, which name is applied to *A. Unedo*, peels off in the same manner as that of the London Plane, showing a pretty greenish-yellow under-bark. Besides the two already mentioned, there are others worthy of notice, particularly *A. Andrachne*, *A. U. Croombi*, and *A. U. microphylla*.

*Carpenteria californica* is a shrub of recent introduction, having large snow-white single flowers, with a central mass of yellow stamens. The flowers are much like those of the Japanese

*Anemone*. It is a robust grower in the southern counties, having dark green leaves of moderate size. It is also hardy when given a little shelter on the cold, wind-swept east coast of Scotland. *Romneya Coulteri*, the Californian Poppy, has flowers not unlike the foregoing, but the habit of growth is entirely different. It is an erect plant, with wiry shoots and glaucous foliage, but is not so hardy as the *Carpenteria*. It requires a sheltered spot even in Devon, though at Kew this plant takes its chance with other subjects.

*Hypericum patulum* was figured in the *Journal of Horticulture* for October 31, 1901, page 405, and the comments there made in reference to this pretty dwarf shrub may still be in the minds of those interested. It was flowering in this Exeter nursery on November 15. The rosy-pink-fruited *Euonymus europæus* is indeed another invaluable shrub, and one regrets that so few gardeners seem to appreciate this native representative. In suitable quarters it attains to 20ft high, and being a native tree it is found flourishing almost everywhere. I am not sure that it fruits freely in any county, but at Exeter and various places in the Midlands I have noted its richly attractive display of bright pink fruits with their orange-coloured aril showing from within. This, the Common Spindle tree, is much used as a stock for grafting the choicer varieties. For its decorative qualities when in fruit it is well worth growing. *E. e. latifolius* has rich crimson fruits.

The hybrid *Escallonia exoniensis*, for which there is a growing demand, is peculiar to the Exmouth and Exeter neighbourhood, and though known by name to many, its merits have yet to be tried by the great majority of growers, and to those who are planting, or about to do so, it might be given consideration. Those fine shrubs, *E. macrantha*, with crimson flowers; *E. Philippiana*, usually smothered in white; and *E. rubra*, with deep red flowers, were noticed along with others. The *Magnolias* are too numerous to individualise, but attention may be called to the true Exmouth variety of *M. grandiflora*, which was pointed out to me, and has the reputation of being an improved form of the type. That finest of all spring flowering shrubs, *Magnolia stellata* (Halleana), with spotless white flowers of star-like shape, and which is a suitable dwarf shrub for forcing in pots or for beds on lawns, is "well done" at Robert Veitch's, and *M. Watsoni*, and *glauca*, and *Lennei*, and *Soulangeana nigra*, all amongst the very best, are included.

More might certainly be made of the various *Elæagnus*, particularly the variegated *pungens maculatus* and *reflexus variegatus*, both of which are shapely evergreen sorts. There is a goodly list to choose from, however, and most of them can be made to serve a useful purpose, being hardy. The *Desfontainia*, mentioned in the Killerton notes as having flowered resplendently there, was seen to equal advantage here; whilst the *Embothrium*, or Fire Bush, of course was quite at home.

In dealing with the whole array of trees and shrubs (which amount to hundreds of genera and thousands of species and varieties) in a nursery such as this, the constant difficulty arises in what to name and what to omit. It has been already stated that most of the choicest introductions of later years are grown by the firm, and there are, too, plentiful quantities of many shrubs and trees which nurserymen further north cannot undertake to cultivate on anything but a very minor scale on account of possible loss by frost; and the trees and shrubs most generally in demand find the congenial Devonshire climate very much to their liking, and they thus assume a well developed character and rich colour. The ornamental *Coniferæ* were especially satisfactory on the latter point, and of them one may name *Thuyopsis dolabrata*, which forms straight leader shoots, and grows many feet high; *Cupressus Lawsoniana aurea*, in beautiful pyramids, 10ft high; *Cupressus macrocarpa*, seen here in such beauty as is not equalled elsewhere; *Pinus insignis*, densely clothed with rich green slender needles; while *Picea Pinsapo*, *Pinus Laricio*, *Abies cærulea*, *Thuia Lobbi*, *Taxodium distichum* (superb young trees), *Retinospora pisifera aurea*, *Wellingtonia gigantea*, *Retinospora Lobbi gigantea*, *Taxus argentea variegatus*, and *Juniperus chinensis aurea*, as typical and well-known *Conifers*, were each represented in large brakes, and every subject perfect in contour, development, vigour, and shade of colour.

One feels compelled to name certain flowering subjects in addition to those already named whose unusual luxuriance could not pass the eyes of anyone interested in this class of nursery stock. Among these are the golden-amber bushes of *Diploppus chrysophyllus*, less known perhaps under the name of *Cassinia fulvida*. This is a dwarf, close-growing pretty shrub, of much value. *Choisya ternata*, too, with its white clustered flowers and glossy green leaves, is worth its place everywhere. The same may be said for the Spanish Broom (*Spartium junceum*) and for *Genista aetnensis*, *præcox*, *hispanica*, and *capitata*; while the many fine *Cerasus*, *Cratægi*, *Cotoneasters*, and *Ceanoths* include a host of indisputably beautiful subjects. The fruit and Rose nursery is situated at Howell Road, but both the fruit trees and the Roses, in the middle of November, were assuming their winter condition of leaflessness.—WANDERING WILLIE.

## Some Non-competitive Pears.

Names of Pears are by many culled from the exhibition tables during the autumn months for the purpose of adding additional kinds to existing stock, or to form a new collection; a most commendable action, be it said, where fruit is desired for the brief period of the winter which such a source would furnish. Usually, though not invariably, fruit exhibited are ripe, or on the verge of ripeness, when exhibited; not that this should be, though it is often made, a favourable consideration in the awarding of prizes. There are some Pears—indeed, a good many—that never find their way into an exhibition, simply because their size, appearance, or season renders them ineligible. To say there are far too many Pears in cultivation does not require emphasis, for out of a large selection there are very few which combine a season outside the months of October and November, and for ordinary home consumption it does not require any stretch of imagination to consider how few are actually required for those two months. With Pears, however, there is such a vein of uncertainty; a variety good, it may be extra good, in one season may be almost worthless another. So many are impatient in waiting for their turn, and when there are a fairly large assortment, all ready to be dealt with at the same time, there is sure to be losses more or less severe.

Doyenné Boismond is a Pear somewhat similar in colour, though more round in shape and smaller in size. This has a very good quality, juicy, rich, and melting, and what is so commendable is that, like the first-named, it keeps soundly until some others are gone. For this reason it is deserving of a space for two trees, where some better known ones will afford sufficient for their time from one tree. It is a French Pear that does not find a place in Dr. Hogg's fifth edition of the "Fruit Manual." It may be truly said there are many less deserving, though much better known.

Althorp Crassanne is a Pear I have a good opinion of for three reasons; namely, regularity of crop on bush-grown trees, most distinct flavour, and accommodation in its keeping powers. This is a variety without any external beauty, pale green, without even a freckle or sunny flush. Its rich, perfumed flavour, extreme juiciness, buttery texture, and white flesh combine all that one can desire in a Pear. None among our early winter sorts remain so long in a sound state, a quality certainly deserving of recognition.

Seckle, one of the smallest of Pears, combines even greater depth of flavour than Marie Louise, and is, in this respect, really excellent. It is a very tempting Pear with birds, especially

tomtits. This is so marked that, unless protected, but very few fruits remain sound enough to store. It is fairly free in fruit as a bush tree, and on account of its high flavour one tree ought to be grown where space allows.

Passe Colmar is a small sized, nicely-flavoured Pear that extends beyond the span of October and November, strictly Pear months; that also crop very well as an open bush. Its many synonyms would point in some degree to a merit above the average of Pears. On a wall, no doubt, the fruit would be larger and more attractive, though quality may be no better.

Olivier de Serres is another good variety, not of the competitive order, for no other reason than its lack of size. In quality it ranks far before Pitmaston Duchess, so much favoured for show purposes, and will keep well. Some find it last into February; but it has not favoured me into quite so late a period of the winter.

President Barabé is one that has acquired fame within later years, not because of its large size, for this certainly is an absent attribute, but rather for its keeping and cropping qualities, which are the more desirable. It is most distinct in character, especially its large, open eye and extended segments. In this respect it differs from almost every other known Pear.

Bergamot Espereu should also enlist the favours of the planting season, because its time of use steps out of the old into the early months of the new year; and while it has this good character to recommend it, it also develops a fine flavour—a point of much value.

Winter Nelis is too well known to expect much notice; yet, while its small size dwarfs its chance, pitted against some of the later show Pears, who can find a fault with it on any other point? If it has one, it is found in its small crop given on bush or pyramid trees. It is worth, and really deserves, a space on a wall.—W. STRUGNELL.

## The White Japan Anemone in a Chester Garden.

The White Japan Anemone is not the type plant, for that bears pink-coloured flowers. According to the author of "The English Flower Garden," the albino form originated at "Verdun-sur-Meuse, in the garden of M. Jobert. From a large tuft of *A. japonica* (pink), a stem arose with pure white flowers." The name of this white Anemone is Honorine Jobert. By the kindness of Mr. G. P. Miln, of the Grosvenor Museum, Chester, we have the privilege to depict a border of this white variety, as photographed in the garden of Captain McGillycuddy, at Bach Hall, near Chester. This is the manner in

which to cultivate such queenly gems—in masses or long and continuous borders. The illustration should serve a useful purpose. The flowering period of the Japan Anemone may be considerably prolonged by having some plants on a north border in the greater coolness and shade, and others on a south. Any friable garden soil will suit it, but undoubtedly the plants respond to generous treatment. Beds once formed may be left for years, and a top-dressing may be given annually after the stems have been cut down. We must congratulate and compliment the owner of so beautiful a garden feature as that here shown, and his gardener too, for the care he must take to ensure such true success.

Anemone japonica in a Chester Garden.

#### Arbutos Berries in Decoration.

The berries of the Arbutos or Strawberry-tree, when obtainable in clusters, are very handsome for use in floral decorations. In Regent Street they are used in a setting of Asparagus Sprengeri in baskets. Within two years these fruits have been offered as edible commodities by certain fruiterers, but they are more attractive to look at than to eat.

#### The Osage Orange.

A tree of the above, about 18ft to 20ft high, is growing on rising ground by the road side at a place called Baileywick, between Petworth and Pulborough, Sussex. It has not so many fruits this year as last year, nor are they so large. A large Horse Chestnut tree is growing close beside it, sheltering from north-east winds. This "Orange" (*Maclura aurantiaca*) is very interesting.—J. B., Petworth Park, Sussex.

#### Chrysanthemums in the Last Analysis.

In the audit of last season, of the Japanese section it is interesting to note that of those varieties which were placed in the first, or "best fifty," the following were not to be found in either of the first or second prize sets in the great vase class, nor the first prize "forty-eight" in the N.C.S. exhibits, viz., Edith Tabor, Lord Ludlow, Phœbus, Mutual Friend, Vivian Morel, Chas. Davis, and Lady Hanham, nor Florence Molyneux, which leads the list of the best fifty in the audit named. Of course, the season may be responsible for some of the missing ones. On the other hand, the following, which were not placed among the "best fifty," were shown in the first and second prize "forty-eight": Sensation, Madame P. Radaelli, Madame B. Wilde, Mrs. G. Golder, Bessie Godfrey, Ethel Fitzroy, Mrs. T. W. Pockett, Duchess of Sutherland, Kimberley, Mrs. R. Darby, Mafeking Hero, Mrs. E. Hummel, Miss Elsie Fulton, and Nellie Bean, whilst the following found a place in the first and second prize exhibits in the vase class, although omitted in the best fifty of the audit: Madame P. Radaelli, Sensation, Godfrey's Pride, and Loveliness. The audit is sufficient to prove that a great change has taken place in only one season.—W. J. GODFREY, Exmouth.

#### Jottings on Pines.

Young plants need liberal ventilation at this time of year to prevent a soft attenuated growth; therefore, afford fresh air whenever the weather be favourable, and avoid damping, as keeping the houses saturated is more injurious than beneficial. Water will be little required, yet the plants should be examined about every ten days, affording a supply to such as need it, and those only; yet extreme dryness is injurious, for any limpness is had at the expense of the tissues, the cells being more or less impaired for growing activity on a recurrence of favourable conditions for development. Lose no opportunity in the fruiting department of closing the house at 85deg, keeping the night temperature at 70deg, or a few degrees less in severe weather. Remove all superfluous suckers, retaining one only, or, at most, two, if stock be required, and then the fruit is more or less sacrificed in favour of the suckers. Such stock, however, is not desirable, for the plants are likely to have the same proclivities as the parent ones. At this time of year it is usual to make new beds of fermenting materials for the young plants. Tan is the best, but it is difficult to procure in some places, more so now than formerly, when less chemicals were used. In most country places Oak or Beech leaves can be had for the collecting, and this being done whilst they are fairly dry, they form an excellent substitute. Those intended for use later on cannot be too dry, placing them in stacks, forming a span-roof and thatching roughly with coarse material, or bracken, reeds, coarse hay or straw. In forming beds of leaves they must be put together as firmly as possible, treading well after placing in a layer of leaves evenly shook out, and so on. Thrown in any way the material settles very unevenly, and gives far more trouble afterwards than needed to do the work properly at first.—PRACTICE.

#### Poterium canadense.

One of the best of herbaceous plants that flower during August is found in this Poterium. It may be likened to a *Cimicifuga* reduced. These plants, together with the pretty *Veronica longifolia*, its varieties and its allies, constitute, when grouped, a novel feature when flowering in the herbaceous border, because of their long spikes. *Poterium canadense* is a very suitable subject to associate with marsh plants, as it grows and flowers very well in a moist situation. Where the practice of growing herbaceous plants in the kitchen garden is carried out, the writer has occasionally seen very large and luxuriant plants of *Poterium canadense*, the liberal treatment bringing it to perfection. In some gardens its name is unknown; in others it may be found labelled *Sanguisorba canadense*, which is perhaps its best-known appellation.—D. S. FISH.

#### Crocus caspius.

Everyone loves the Crocus, but it is not all who venture to leave the beaten track and grow any but the large Dutch spring Crocuses. There is an increasing band of enthusiasts who prize the different species, which are particularly suited for those who possess rock gardens, where the autumn and winter flowering species can be better protected than in the open border. The readers of our Journal who are among the number will no doubt be gratified to learn that *Crocus caspius*, which has been awaiting introduction for many years, has at length found its way into cultivation, and will probably soon be offered by a few specialists in the bulb line. It comes from the borders of the Caspian Sea, and has been sent by the collector employed by a small syndicate. Two well-known amateurs were members, and they have received their share of the collection in capital condition. This Crocus flowers in October and November, the blooms being white, tinged with yellow on the exterior of the petals. *Crocus caspius* is likely to be hardy in this country.—S. A.

#### Carnation, Lady Nora Fitzherbert.

This new Carnation, which received a first-class certificate at the autumn show of the Royal Caledonian Horticultural Society in September last, is probably one of those which will give us a number of useful varieties on account of its floriferousness and the dwarf habit it possesses. It is, I believe, a seedling from Germania, a yellow which has not yet been superseded, and it has retained the fine colour and floriferous habit of its parent, with a new habit in the shape of dwarfness. It grows only some 8in or 9in high, and is so sturdy in its growth that it requires no staking. If Messrs. Laing and Mather, of Kelso, who raised the plant, can only give us a number of varieties of the same habit we shall be greatly indebted to them. Exquisite as are the Carnations of the time for cutting, a bed disfigured by wire or other supports is not so pleasing as it should be with such lovely blooms as the Carnation gives. With Lady Nora Fitzherbert, however, one might have a splendid bed or edging, while for a front row in the Carnation house we could hardly have anything better. The plants appear all that we can desire for vigour and for freedom in producing "grass."—S. ARNOTT.

#### Floral Variety in November.

The following list of flowers were in full bloom in Westley Hall Gardens, Bury St. Edmund's, on November 11, 1902: *Achillæa tomentosa*, *Ageratums* (in profusion), *Agrostemma*, *Autirrhinums*, *Alyssum*, *Anemones*, *Auriculas*, perennial *Asters* in variety, *Aubretias*, Japanese *Anemones*, *Calceolarias*, *Coreopsis* (in profusion), *Canterbury Bells*, *Chrysanthemums* (in profusion), *Clematis* (purple), *Chrysanthemum maximum*, *Cornflowers*, *Dahlias* (in varieties), *Dianthi*, *Eschscholtzias* (yellow and white), *Erigeron philadelphicus*, *E. mucronatus*, *Fuchsias*, *Geums*, *Godetias*, *Gazanias*, *Gladioli*, *Helenium pumilum*, *H. autumnale*, *H. striatum*, *Heliotrope*, *Jacobæa*, *Lavender*, *Love-in-the-Mist* (*Nigella*), *Leycesteria formosa* (small bushes), *Mignonette*, *Nicotiana affinis*, *Nemesia strumosa* Suttoni, *Marigolds*, *Tropæolums* (*Nasturtiums*), *Montbretias*, *Oenothera taraxacifolia*, *Æ. Youngi*, *Pentstemons*, *Phlox Drummondii*, *Iceland Poppies*, *Plumbago Larpentæ*, *Pyrethrums*, *Prunella vulgaris*, *Pansies*, *Roses*, *Sweet Peas*, *Scabious*, *Sunflowers* (miniature), *Trollius europæus*, *Rudbeckia Newmanni*, *Spiræas* (shrubby), *St. John's Wort*, *Tropæolum tuberosum*, *Violets*, *Verbena* (sweet-scented), *Valerian* (red and white), *Veronica repens*, *Wallflowers*, scarlet *Pelargoniums*, bedding and Ivy-leaved. Our place is very high.

### Illegal Showing.

It is clear, from the three excellent letters in last week's *Journal*, that this matter is much more prevalent than I, for one, had any idea of. I am sure, Mr. Editor, you will allow it is of the utmost importance, and I hope you will not, if possible, let it drop till some means have been suggested for effectually dealing with it. "Withholding prizes fraudulently won," as mentioned by Mr. Wm. Taylor, ought to be sufficient, but is not when the matter has got so far as it seems to have done. Prosecution in a law court seems now wanted to clear the air. I thoroughly agree with the capital letter of "Quiz," who has convinced me I was unjust to "A Yorkshire Grower," and owe him an apology, which I here heartily offer. I had no notion the matter had gone so far, having, it seems, as "Quiz" suggests, not been "privileged to peep behind the scenes." If I had been, there would have been a shindy, if he will take my word for it. But what about Mr. Wm. Taylor and the Grapes? (page 512). Had he no alternative? I think I would have tried pretty hard to find one, even if it consisted in resigning my office as judge right off and leaving the place. But it is pretty clear, from his statement about the secretary, and the other letters, that it is the executive—the officials of the shows—who are most to blame, by refusing to take action, and winking at dishonest proceedings. Quis custodiet ipsos custodes? It is very difficult to say. When things have got as bad as these letters seem to show, a "reign of terror" is set up to a certain extent, and it is, one must acknowledge, a serious matter for one in a dependent position to "bell the cat." I can only suggest that honest men in each society put their heads together, stand by one another, and put forward a general motion without reference to any individual case, at the annual meeting. Still, it does seem as if there must have been originally, when the evil was beginning and before it had grown strong, a little want of pluck among the honest men.—W. R. RAILLEM.

After the appropriate remarks by "W. R. Raillem," page 490, in reply to "A Yorkshire Grower," on this subject, one would think that the latter must be now convinced that he has missed a golden opportunity of doing his part towards arresting the evil he complains of. I believe that all horticultural societies have a rule embodied in their schedules, with the object of protecting honest exhibitors against such practices as "A Yorkshire Grower" alleges to have taken place, within his own knowledge. Committees of management cannot very well act on vague assertions and cautious innuendoes. If those in possession of such facts were to bring these timely and promptly before them they would be obliged to act, according to their own rules. This subject has given "W. R. Raillem" an opportunity of having a dig at the management of northern exhibitions, of which he avails himself thus: "This is not the first time that exhibitors 'living down south' have heard whispers of lax proceedings in the north, and even that they are winked at and condoned." This statement is so vague that it is impossible to deal with it. After, however, noticing the observation made by "F. W." respecting the National Chrysanthemum Society and its management—bringing to mind something more than whispers of similar things in the past—down south, the thought occurs that the reproof or injunction in reference to the "beam in your own eye" might fitly apply here. The naïve saying by Artemus Ward that "there is a great deal of human nature in man" is frequently manifested in many ways, whether it be "down south" or "up north." I happen to have some experience of exhibiting in the south, but considerably more so in the north, and I know of no committee of management there who would tolerate or wink at or condone such practices as "Yorkshire Grower" possesses knowledge of, if these were brought clearly and timely before their notice.—R. M., York.

### The Scarcity of Journeyman Gardeners.

After reading your correspondent's remarks (page 513) on the above, I can say the best way out of the difficulty is to offer better wages for first class journeymen, then, perhaps, some of them will not be in such a hurry to get foremen's places. In advertising one should state that only those who have had a good training should apply. This is a time of competition, and young

men growing up with active brains are looking round to see how and where they can get best wages, and gardening may some day have to be paid on a higher scale. Wages have risen among mechanics and indoor servants, and when we consider what is required of a head gardener and his under-men I think all employers ought to be pleased to improve the scale of wages, so as to uphold horticulture in this country in the best possible way.—A. J. L.

### A Mild Season.

In last week's *Journal of Horticulture* you record some interesting and unusual things about various crops of fruit gathered in November. To-day, December 5, I send you Strawberries just gathered from a seedling, St. Joseph, from the open ground. Unfortunately for the Strawberries, the frost of last night has stopped further progress in ripening.—W.

A nice dish of Raspberries, of which we send you part, was picked in the garden of Mr. G. N. Burden, Oakfield, Teignmouth, to-day, December 2. We doubt if the Riviera could produce better in December. We thought it would be of general interest as showing the mildness of our climate.—W. HANNAFORD AND SON, Teignmouth, Devon.

### Fugitive Notes.

"MANY MEN, MANY MINDS."

In the *Journal of Horticulture* for December 4, "G. H. H." gives expression to thoughts which doubtless have frequently arisen in the minds of many people conversant with the number of plants, fruits, and vegetables that, year in and year out, pass before the R.H.S. committees for honourable mention, or that silence, standing so often for condemnation. That the method of sitting in judgment upon the various products brought to the notice of the committees has its drawbacks, few will be slow to admit; but who can point out a better way? It is obvious to anyone that whatever is shown at the Drill Hall is sent in its best possible condition, and that the censors must appraise its merits, novel or otherwise, as it appears before them, without relation to habit of growth, difficulties of culture, &c. There are, it is true, exceptions when allowance can be made on these points; and when this is the case, a novelty can be more nearly esteemed at its proper worth. But here is without question the great drawback to the present system of awarding certificates, and the reason why so many of the honours awarded confer on the recipients benefits of such a fleeting nature. Still, it is to be feared that no better plan is likely to be forthcoming. We must go on taking for granted that whatever has been approved and honoured by the R.H.S. must be worth buying and growing, and only by actual trial under everyday conditions do we find that this plant with the mystic A.M. attached to its name, or that fruit so lately granted a F.C.C., fail to satisfy the needs of those who desire a combination of beauty and utility.

### An Imposing Almshouse.

Whether rightly or wrongly the above was the ejaculation that involuntarily arose to my lips when the illustration of the plan of the proposed Hall of Horticulture was disclosed to my view on page 521. Mr. Shayler's modifications may be, and no doubt are, everything that could be desired as far as they go; but, alack! modifications here will scarcely meet the difficulty. Mr. Wood's suggestion of competitive plans would involve a loss of time and some extra expenditure, and truly both might well be sustained in the hope of securing a properly arranged structure, and outwardly a fitting edifice, which for many, many years to come must be the centre of the horticultural life of this country. It may be as well to say that against the plan, as a plan, I have not a word to say, for some purposes it is possible the ideas it embodies might be everything desirable.

### Illegal Showing.

This subject is a very old friend to those who have studied the pages of the *Journal of Horticulture* during past years. Nevertheless, it is a matter that will bear repetition and stirring up. That there are still those among exhibitors who lack a proper sense of right and justice in competition with their fellows is well known; yet to counterbalance this we have a great body of those whose rigid uprightness is in itself no light answer to the charges so recently brought against showmen in these pages.

## N.C.S. Judges.

The complaint of "F. W." under this heading in a previous issue reminds me of the words of a friend: "Whenever you hear a man grumbling about judges or judging, you may be sure in nine cases out of ten that he is a disappointed exhibitor." How often this has proved correct I am not prepared to say; but frequently it has come true in the past under my own observation, and I have not the slightest doubt the trouble will arise many a time and oft in the future.

## The Scarcity of Journeymen Gardeners.

Here again we have an old friend very ably touched on by "E. E. R." on page 513. That there is a scarcity of young men willing to devote themselves to a gardener's career is not to be wondered at if the attractions and greater emoluments of other avocations are for one moment considered. "E. E. R." is afraid the coming generation of gardeners will not enjoy the palmy days of their predecessors. One would have thought that with a coming scarcity there would have been a tendency for higher rates of payment and greater privileges. It is not wise to look too far ahead, but if the experience of the present generation of gardeners is at all reliable as a basis for forecasting the future, expert gardeners will be needed in but few establishments in time to come. The man in the street, or his employer who reads a gardening paper once a month, if to be believed, may be expected to know more of the craft than those who have served a lifetime in the ranks.—A PROVINCIAL F.R.H.S.

## The Horticultural Hall.

It is an old adage that what is everybody's business is nobody's business, although, fortunately for the reputation of the world, there is far increased disinterestedness and singleness of purpose awakened of late years, which proves our march to a higher plane. Relatively to wealth distributed in the world, our great Babylon constitutes an unenviable exception in the race for honourable distinction in this connection, and the spirit of sordid venality is more or less prominent. Many of the sections of the administration are unevenly balanced in this vast metropolis, and we see utter neglect of first principles here, and lavish prodigality there, within a stone's throw of each other. London can furnish no brilliant example for imitation by less notable centres. This condition of things is prominently noticeable in relation to horticulture, which suffers ignominy, especially at the hands of our numerous so-called amateurs in well-to-do positions, who, in reality, are much more numerous for the purpose of carrying off substantial prizes for exhibits than showing backbone in furthering the behests of horticulture in a national sense. If we measure not the potential, but the actual, wealth of these isles against that of the United States, we may, in a sense not geographical, compare our English counties to the States of the great American Republic in this way, that, as an instance, the county of Kent might be likened to the State of Massachusetts, and allowing the section of London on the Kentish soil to count as Boston does in that State. Now we find that pushful Boston has been on the qui vive after a horticultural hall coincident with London, and has dedicated a goodly sum, equal to £120,000, towards the grounds and hall for a suitable establishment. Kent, with the section of London pertaining to it, is probably as affluent as Boston and its State, yet it not only does not equal Boston in its horticultural worth, but Kent, the "Garden of England," and the whole of London besides, and the latter as the representative of the wealth of the kingdom and the dignity of the Empire, cannot collect towards the ideal hall and its cost more than the fraction beyond £100,000 out of the £120,000 already secured by Boston. And the Boston Hall is completed during the same few years that London has wasted in ruminating, and has in effect been literally overwhelmed by the attenuated claim on its prodigious resources for a sacrifice on the altar of horticulture.

We have been authoritatively informed a few weeks ago by the Royal Horticultural Society that the total promised towards the hall is just over £18,000, where the modest sum of only £40,000, for the metropolis of the world, is the limit of the claim for the hall. If these figures here mentioned could not be substantiated, the proportions cited seem to constitute a gross libel on the love of flowers, which is assumed, at least, to pervade the nation, and to assist in its æsthetic elevation to a point in this connection abreast of the world, which we have a claim to lead by the ethical magnificence of some of our national institutions.

But this comparison does not even show us true proportions. About twelve years ago a similar attempt at the creation of a hall was on the point of succeeding, about £27,000 having been promised towards £40,000 required, when the unfortunate Baring Crisis knocked all financial matters on the head, and the

project disappeared from among practical politics. It was an evil time for London and true horticulture. These £27,000 were promised among Fellows of the Society, numbering under 2,000, twelve years ago, whereas the present numbers are three times greater, or about 6,000, showing the intended sacrifice of £14 per head on the previous occasion, and only £3 promised on the present one.

Nor is this the only ground on which "love of flowers" merely skin-deep can be proved in wealthy Britain. The flimsy superficiality is emphasised when we read of 1,000 applications, as occurred the other day, received by the owner of one private garden requiring a head gardener. Horticulture is actually going begging, which finds significant expression in the parallel case that few private establishments care to afford anything beyond the kind of plants that can be most effectively ravished for the decoration of dinner-tables and other social sensations—flowers to be cut! Yes! plants to cut from; we want nothing else! reiterate our *nouveaux riches*, and, alas! many of the *anciens riches* as well.

Mr. Ebenezer Howard is proposing to develop the problem of garden cities among us in order to raise our standard of life from the present sordid environment; £20,000 were required to start preliminaries—the Pioneer Company—and this sum has been furnished as an act of philanthropy from among the (about) 1,700 members constituting the Garden City Society. All but £1,000 subscriptions—viz., £19,000, have been promised in the course of less than six months, so that virtual success crowns the effort.

The Royal Agricultural Society recently, in fixing upon a permanent locality for its great annual show on a site near Willesden, easily obtained the necessary funds from its Fellows within a short time, and furnishes another object-lesson for the accentuation of the perfunctoriness of purpose attaching to the cult of Flora in the well-to-do circles of this great metropolis. As to the rapidly increasing ratio of the annual growth of the memberships of the R.H.S., we would fain desire to claim the greater proportion as devotees from real love of horticulture, intent upon furthering its true interests, and not merely joining as a freak of fashion. Were the former hypothesis admissible, London might rightly, and with real pride, have been enabled, logically, to point to the creation of an adequate mansion and real home of horticulture, set appropriately in park-like surroundings, instead of being compelled, after a sojourn in a quasi-dungeon, humbly to adopt a retreat which seems to be inadequate to needs of even early coming years, and demanding ten times the amount now modestly required.

I think I read a recent statement that about nine-tenths of the sum total promised are attributable to the Council of the Royal Horticultural Society and their older and nearest friends, which would further emphasise the extreme want of sympathy on the part of the many well-to-do or even affluent people, whose joint promises come to a couple of thousand pounds out of about £18,000 promised on this reckoning. Also some of those exploiting the modest space for their trade exhibits are far from being conspicuous in recognising their liability. As a case in point, the modest hall proposed seems to be inadequate to the requirements of our Rose and Chrysanthemum Societies for their annual shows, which is a matter doubly regretful, as the Aquarium is on the point of disappearing, which hitherto gave shelter to Chrysanthemum interest. Even King Edward and our Prince of Wales cannot stimulate fashionable enthusiasm, though they have kindly sent contributions.

A correspondent in one of your contemporaries asks what is the cause of the existing state of the gardeners' labour market, and vaguely replies that it cannot be that employers are taking less interest than hitherto in horticultural matters, judging from the increase of the number of new Fellows elected to the Royal Horticultural Society. My earlier reference to these numbers may slightly modify his optimism. Finally, he opines that it is now more a matter of wage than anything else. According to my point of view, the extremely low wages mostly prevailing for service of really good gardeners, from whom much is expected, provide another peg on which to expose the relative degeneracy of horticulture on its own account. Employers who would make horticulture their obedient slave infinitely outnumber those aiming at a superior plane in their sympathies. The true meaning is the ignorance and indifference of employers in most gardening matters, ignorance which proclaims itself in that of most of the "common things" in our environment.

The suggestion made on page 488 of your issue as to structural improvements on the plans submitted by the R.H. Society should find full application, for they are decidedly good.—H. H. RASCHEN, Sidcup, Kent, December 1, 1902.

P.S.—We are editorially, but apologetically, informed in the "Gardeners' Chronicle" of December 6, in relation to this subject, that "one need not point to Boston, Philadelphia, or even to Amiens, because the conditions might not be applicable to us." Such a sentiment seems to be a feebly disguised acknowledgment of our ineptitude and illiberality and another spirit elsewhere. Nor does the "noble work accomplished by the Shropshire Horticultural Society," referred to in the same issue, "alleviate

some of the humiliation we should otherwise feel," any more than the private munificence that benefited Liverpool so greatly of late years in this connection. It supplies in no wise extenuating circumstances, but emphasises the want of the sense of proportion from which the execution of this problem suffers in our great metropolis.

The limited results so far attained are of an extremely humiliating character. It is by no means too late in principle, and in fact, to conclude that an infinitely greater effort will yet be made in order to place us abreast of the moral claim which

charge of gardens should have a wide knowledge of plants of all sorts, and make it an aim in their professional practice to resuscitate, or bring forward from time to time, classes of plants of different characteristics, and to cultivate each in its turn to the greatest perfection. Herein lieth the true art of gardening, and the secret of its wonderful interest. Instead of gardeners in different gardens striking out in lines of their own, one finds that all, or nearly all, follow the beaten track. *Jacobinia chrysostephana* has been taken in hand by Messrs. J. Veitch and Sons, Limited, of the Royal Exotic Nursery, Chelsea,

***Jacobinia (Cyrtanthera) chrysostephana.***

horticulture and our environment emphatically impose upon us, and that some public-spirited men of wealth will yet join the chief donors. I am authoritatively informed that the £20,000 desired by the Garden City Association had been fully subscribed.—H. H. R., Sidcup, December 6, 1902.

#### **JACOBINIA (CYRTANTHERA) CHRYSOSTEPHANA.**

This plant is one of many others whose great merits have been, or are, entirely overlooked by gardeners. We consider it an essential quality in the faculty of gardening that those in

S.W., and when plants were exhibited by them before the Royal Horticultural Society on November 18, an Award of Merit was bestowed by the Floral Committee. It is an Acanthaceous member, introduced from Mexico in 1870, and has been figured in the "Botanical Magazine (t. 5,887), under the name of *Cyrtanthera chrysostephana*—the corymbose flower-heads being golden yellow, or rather golden apricot in colour. Our illustration gives a good idea of the terminal clusters. The plants are treated the same as *Justicias*, which are easy stove subjects to cultivate. A number of well-flowered and foliaged plants furnish an invaluable addition to the stove in winter, and they are of a very serviceable height—1½ft to 2ft high when grown in 5in pots. Messrs. Veitch's plants were cultivated in their new branch nursery at Feltham, Middlesex.

# NOTES & NOTICES

## Appointment.

Mr. Wm. Taylor, late head gardener at Rockingham, Boyle, Co. Roscommon, as head gardener to Mr. Walker, at Bradfield, Cullompton, Devon.

## Eucalypti as Water Storers.

Eucalyptus and other trees of the Australian deserts store up water, which the natives obtain by cutting up the roots and standing the pieces on end.

## Royal Meteorological Society.

At the ordinary meeting of the society, to be held at the Institution of Civil Engineers, Great George Street, Westminster, S.W., on Wednesday, the 17th inst., at 7.30 p.m., the following papers will be read: "The Climate of Cyprus," by C. V. Bellamy, M.Inst.C.E., F.R.Met.Soc.; "The Eclipse Cyclone of 1900," by H. Helm Clayton. As the balloting list for the council for the year 1903 will be prepared at the next council meeting, it is requested that those Fellows who wish to suggest Fellows for election on the new council will send in proposed names before the 16th inst.—W. M.

## Coronation Park for Ormskirk.

The fine old Lancashire town of Ormskirk will at no distant date be enriched by the addition of a public park, the plans of which are now before the Urban District Council. The extent of the ground is 7½ acres, and provision has been made for a lake with central island, approached by rustic bridges, with a 9ft walk round the inside of the park. Lord Derby receives £2,000 for the land, and of this sum he will, with his usual generosity, remit £1,000 when the scheme is carried out. At the council meeting held on Tuesday it was announced that Lord Derby had also given without payment other land that the sub-committee found would be required to bring the scheme to a successful issue.—R. P. R.

## Mushroom Farming.

This time of year is the best season for the Mushroom farmer. The man who now has his Mushroom beds full can make money every day. A great many market gardeners say that Mushroom farming does not pay, as the expense involved in the production of the delicious fungi runs away with all the profits. The two difficulties in producing Mushrooms are the necessity of a high temperature and the requirement of a very large quantity of manure. The Mushroom beds must be kept at a temperature of about 60deg, and it takes about £15 worth of manure to produce a ton of Mushrooms. The value of a ton is about £50 at this time of year, so that the possible profit appears large, but there are many other expenses besides the cost of manure. August and September are, of course, bad months for the Mushroom grower, for the fungi can be picked out of doors at that time of year.

## A Competition for a Bothy Plan.

The warmly supported discussion of the young gardeners' bothy question, which lasted over a number of our issues in the early summer of this year, will be fresh in the minds of readers. It was then proposed to call for competitive plans of a comfortable bothy for gardeners, and this competition was fixed to be closed by Christmas. It was not deemed a difficult matter to draw a suitable and simple bothy plan, but during the long days of summer and autumn the Editor believed that few had time or the desire to take up rule or compass. The plans now ought all to be in our hands by Thursday, December 25. The rules of the competition are as follows: The plan, drawn to scale, must not exceed 7in broad by 7in deep, and must be clearly defined on stout paper. The plan must provide suitable accommodation for six men, and the cost of the building ought not to exceed £250 to £300. A statement of the general items of cost should accompany the plans, together with any written comments thereon. The sender's name and full address should be enclosed when sending the plan, and the sender will alone be held responsible for it. The competition is open to all. The prizes are: 1st, £3; 2nd, £1.

## Devon and Exeter Gardeners.

A paper was read at the latest meeting of the Devon and Exeter Gardeners' Association, at the Guildhall, Exeter, by Mr. W. Andrews, of the Exeter Public Grounds, on "Miscellaneous Bulbous-rooted Plants for the Flower Border." The chair was occupied by Mr. S. Radley.

## Newcastle Horticulturists.

The annual meeting of the Durham, Northumberland, and Newcastle-upon-Tyne Botanical and Horticultural Society was held on December 8 at the offices of Messrs. J. Hindhaugh and Co., Cloth Market, Newcastle. The chairman of the society, Ald. J. Baxter-Ellis, presided. The secretary, Mr. I. B. Reid, presented the annual report and statement of accounts, showing a balance in hand amounting to £21 11s. 5d. It was agreed to abandon the spring show.

## Weather in the North.

Winter has at last closed upon us in the north. Since the morning of the 4th inst. dense hoar frost has whitened all the lower grounds, and the higher hills are covered with snow. Frost of from 8deg to 20deg on the mornings of Sunday and Monday has prevailed, but a good deal of sunshine has brightened the past week.—B. D., S. Perthshire.

[Seventeen degrees (Fah.) of frost were recorded on the 6th at Eynsford, in Kent.—Ed.]

## Electroid Gas.

Remarkable properties are claimed for the gas called electroid by its discoverer, Professor Rychnowski, of Lemberg. When condensed, the gas assumes the form of tiny greenish-blue balls, which are elastic like indiarubber, and emit rays under the influence of which the growth of plants and flowers is greatly accelerated, and organic matter is prevented from decomposing. The "Family Doctor" says that Rosebuds burst into flower under it, and flesh meat has been kept fresh for two years.

## Departmental Committee on Poisons.

The Departmental Committee on Poisons, which has been carrying on its work for about a year, and has held some seventeen or eighteen sittings for the reception of evidence, has had a meeting to consider the draft report of the Chairman, Sir Herbert Maxwell. Though the report has not yet been finally adopted, it is understood that it will recommend the addition of a third schedule to the Pharmacy Act, under which persons who are not authorised pharmacists may be licensed to sell poisonous articles of use in agriculture and horticulture, subject to regulations to be laid down by the Privy Council in the interests of the public safety. These regulations are expected to insist on special shapes and labels for bottles and packages containing poisonous substances, and other alterations are also to be recommended in the Pharmacy Act schedules, which will have the effect of liberating the sale of sheep-dips, insecticides, and other similar articles, which has hitherto been restricted to pharmaceutical chemists, and placing it under reasonable restrictions in the hands of persons more directly concerned with agricultural and horticultural industries.

## Notes from Hamilton, N.B.

The variable nature of the weather for some time past has now given way to frost. Few will be sorry for the change, for almost anything would be an improvement in comparison to the wet of the last week or two. This morning (4th inst.) we had 12deg F., a rather hard frost right off, and following on a twenty-four hours' rainfall. The consequence was that the ground was frost-bound, and though trenching or digging were possibilities, yet the little now remaining to be turned we prefer to defer till it comes fresh. The soil of this district is cold enough in its normal condition, and we opine that, however beneficial the burying of frost crusts may be in light soil, it must be always a very questionable action to bury them in cold clayey soils. This district is very much engrossed in the game of curling when the frost sets in, and not a few will hail the advent of the present auspicious prospects with delight. A day or two on the ice renews the vigour so much used up during the trying times of the past season. And the gardener, if any person requires revigoration, is certainly one who does. So we wish him to have his few days' frost and a good game at the grand old sport—the roaring game.—D. C.

**Gainsborough's First Public Park.**

Gainsborough will soon be in possession of its first public park, which is to be laid out at the back of the waterworks. A tree-planting ceremony in connection with the event took place on Saturday, those who set the saplings being Mr. Barlow, the High Sheriff, the Rev. F. H. Dalby, Miss Barlow, Miss Jarman, and Miss Dixon.

**The Chrysanthemum Analysis.**

Mr. Edwin Molyneux informs us that he hopes to be able to complete this year's Chrysanthemum analysis in time for our next issue, December 18. With four or five exceptions the voters have now (December 7) returned their papers. We may here add that the issue containing the Rose analysis was "out of stock" in the same week, and this after a largely increased impression had been brought off.

**United Horticultural Benefit and Provident Society.**

The monthly committee meeting of this society was held at the Caledonian Hotel, Adelphi Terrace, Strand, on Monday evening last. Mr. C. H. Curtis presided. Seven new members were elected. Twelve members were reported on the sick fund. Two members were granted £1 10s. each from the convalescent fund. A cheque for £59 18s. was granted to a lapsed member, being the amount standing to his credit in the ledger.

**Freedom of Reading to Martin J. Sutton, Esq., J.P.**

Wednesday, December 3, was a most eventful day in Reading, the occasion being a dual one—the unveiling of the statue of His Majesty King Edward VII., presented to the town by Mr. Martin John Sutton, J.P. (of the renowned firm of seedsmen), and the conferment of the honorary freedom of the borough on Mr. George William Palmer, J.P., M.P., and Mr. M. J. Sutton, as some recognition of the manifold services they have rendered to the town of their birth and to their country. The statue of King Edward is an imposing ornament to this lovely Berkshire town.

**British Folk for Canada.**

Some weeks ago you published a letter of mine in which attention was called to the way aliens were rushing in to settle up the great West of Canada, the finest Wheat belt in the Empire. My suggestion was that English, Scottish, Irish, and Welshmen should go out in large parties to take advantage of the Canadian Government's offer of 160 acres of this fine Wheat land as a free homestead to each man over eighteen years of age. Hundreds of letters have been sent by those wishing to go asking me to organise a large national movement for next March. This is now being done, and already a large party is forming from all over the kingdom for March, 1903, to be followed by a supplemental one in 1904. Those who contemplate going to Canada can obtain all particulars of the movement by sending a stamped addressed envelope to my private address, Alexandra Park Road, Wood Green N. At the same time, it should be distinctly understood that I am not an emigration agent, and that I receive no remuneration whatever from anyone in this matter, neither am I in a position to render financial assistance to those who might like to go but cannot find the funds. Every man must pay his own way, and should be possessed of about £100 upward, though others who have much less may go upon homesteads and work them by co-operating with two or three others. The Canadian Government has been approached to set aside a large area for the exclusive settlement of this party, and the selection is now being completed with very satisfactory results. It will be somewhat larger than the County of Middlesex, and is situated in the now famous Saskatchewan Valley. We have also the assurance that a railway will be laid through the settlement in 1903, to be completed to Edmonton by 1904. Those who cannot go before 1904 will probably be allowed to pay their Government registration fee of £2 here, so that a homestead of 160 acres may be held for them in this same district. I am told that the prospects of the whole Saskatchewan Valley are so good that by 1904 or 1905, with the present rate of settlement, the free grant lands will have been largely appropriated. The Americans have already taken up a large amount; now let us put in a good solid party of British folks, and take the rest before it is all alienated.—(Rev.) GEORGE E. LLOYD, Special Deputation Secretary, Colonial and Continental Church Society.

**Death of Eliza Mary Fenn.**

We much regret to announce the death, on December 6, at Sydney, Australia, of Eliza Mary (Lily), eldest and dearly loved daughter of our old contributor, Robert Fenn, Cottage Farm, Sulhamstead, aged thirty-two.

**Sussex Weather.**

The total rainfall at Abbots Leigh, Haywards Heath, for the past month was 3.47in, being 0.13in below the average. The heaviest fall was 1.08in on the 8th. Rain fell on thirteen days. The maximum temperature was 60deg on the 6th, the minimum 26deg on the 21st; mean maximum temperature, 49.26deg; mean minimum, 38.22deg; mean temperature, 43.74deg, which is 0.54 above the average. This may be said to have been an average November, wet and stormy the second and fourth weeks, otherwise fair weather, but with little sun. The first frost of the season occurred on the 18th and on the four following nights.—R. I.

**November Weather at Belvoir Castle.**

The prevailing direction of the wind was S.E.; total nine days. The total rainfall was 1.53in; this fell on fourteen days, and is 0.87in below the average for the month. The greatest daily fall was 0.30 on the 29th. Barometer (corrected and reduced): highest reading, 30.436in on the 18th at 9 a.m.; lowest reading, 29.218in on the 28th at 9 a.m. Thermometers: highest in the shade, 58deg on the 1st and 6th; lowest, 23deg on the 22nd; mean of daily maxima, 48.33deg; mean of daily minima, 38.30deg; mean temperature of the month, 43.31deg; lowest on the grass, 20deg on the 22nd; highest in the sun, 95deg on the 1st and 2nd; mean temperature of the earth at 3ft, 47.46deg. Total sunshine, 68h 55m, which is 7h 3m above the average; there were eleven sunless days. The temperature has been a little above the average. Dahlias and Scarlet Runners were cut by the frost on the 22nd. Roses have been exceptionally good this autumn.—W. H. DIVERS.

**Bristol Gardeners' Association.**

This society held a meeting at St. John's Rooms, Redland, on the 27th ult., Mr. E. Poole, F.R.H.S., occupying the chair. The subject for the evening was "Fungus," the lecturer being Mr. Harding, of Clifton, and it need hardly be said that his lecture was a most instructive one. Mr. Harding was unanimously accorded the hearty thanks of the meeting. His lecture was much enhanced by fifty water-colour drawings very kindly lent by Mr. Wheeler, Queen's Road, Clifton, which, to say the least, were beautiful in the extreme, and he was voted the sincere thanks of the association for his kindness. The prizes for the evening were for a vase of autumn foliage and berries, for under gardeners only, the prizewinners being Messrs. Heeford, R. Poole, and W. Coombs. A certificate of merit was awarded to Lady Cave (gardener, Mr. Poole), who takes such a kindly interest in the doings of the association, for a Pineapple and a collection of Fungi; one also being awarded to Mr. A. Cole (gardener, Mr. Bird), for a fine bloom of Florence Molyneux Chrysanthemum.—H. K.

**Newport (Mon.) Gardeners'.**

On Wednesday, November 26, the usual meeting of the above association was held, and a very able and practical paper on "The Cultivation of the Strawberry" was read by Mr. P. Garnish, of the Bristol Gardeners' Association. The lecturer, who showed by the very able manner in which he handled his subject, that he was a thorough master of Strawberry culture, first made some remarks on the introduction of the various varieties of the Strawberry, then proceeded to give practical directions to ensure the very best results. He gave directions as to the preparation of the soil, also the runners, advocating growing plants specially for the production of the runners, not allowing them to fruit. A discussion followed, in which Messrs. Jones, Harris, Pegler, Sharratt, and others took part. A most hearty vote of thanks was accorded Mr. Garnish for his paper. Certificates of merit were awarded to Mr. Parkes for a well-flowered plant of *Oncidium Forbesi*, to Mr. Sharratt for two well-flowered plants of *Cattleya labiata*, and to Mr. Long for four splendid bunches of Grapes. Votes of thanks were accorded to Messrs. Wiggins, Harris, Daniels, and others, who staged various plants. Mr. Daniels presided over a good attendance.

### A FOUR-FLOWERED TULIP.

Through the kindness of a correspondent, we some time ago received the photograph of a four-flowered Tulip, of which an excellent illustration appears. It is decidedly uncommon to see or hear of one Tulip bulb throwing four flowers and all on one stalk. In our own experience this is the first instance we can recall. It will be noticed that an offset has also produced a small flower, as shown in the figure herewith.

### Ardgowan, N.B.

Amongst the many stately mansions that bestud the shores of the Firth of Clyde, few can equal, and none excel, in beauty of situation and grandeur of environment that of Ardgowan, the palatial residence of Sir Michael Robert Shaw-Stewart, Bart. Situated upon a plateau overlooking the Firth of Clyde, it commands extensive views of some of the most beautiful and enchanting scenery imaginable, embracing both land and water. From the terrace in front of the mansion the view is one of surpassing grandeur; away towards the right across the waters of the Firth tower the Cowal Hills in rugged grandeur, clad to the summit in their purple mantle of Heather; while at their base and skirting the shore numerous handsome villas peep from out their leafy screen of trees. Right in front but further away lies the fertile islands of Bute and Arran, with the rocky peaks of Goatfell in the latter dimly descried on the western horizon. Close at our feet lie the waters of the Firth, glimmering in the autumn sunshine like a sea of molten glass, across whose shining surface glides many a graceful, white winged yacht; or anon the scene may change when Boreas, in playful mood, comes careering down the rocky glens, lashing the waters in his boisterous mirth, and dashing the white-crested waves with resounding roar upon the rocky beach. Turning to our left hand the eye travels over many a fertile field and woody hillside, with the quaint little village of Inverkip nestling amidst the "tall ancestral trees" in the foreground.

Extensive parks of rich pasturage surround the mansion, and many a noble tree spreads abroad its giant branches, at once giving beauty to the landscape and shelter to the cattle as they lazily browse in the summer sunshine. A well-kept lawn, intersected by gravel walks and judiciously ornamented with graceful trees and clumps of shrubs, stretches out immediately in front of the house; while in close proximity to the mansion there is a neat little flower garden, kept bright during the summer with choice bedding plants. An ornamental stair leads from this up to the conservatory, which occupies a position adjoining the drawing-room, on the second storey. It is of handsome design, and is always kept bright and gay with a choice selection of foliage and flowering plants in season.

After an absence of twenty years it was with genuine pleasure that one day last September we found ourselves once more treading the weedless gravel of the drive that leads from the village of Inverkip towards the gardens. Once again we looked upon the erstwhile familiar scenes, reawakening within our memory many a half-forgotten incident of the bygone days. We were fortunate in finding Mr. Lunt at home, and had the pleasure of inspecting the gardens and hothouses under his escort. Mr. Lunt has had charge of these extensive and beautiful gardens for the long period of forty-five years (surely a record service), and has discharged the multitudinous duties devolving upon him to the entire satisfaction of his appreciative employers, and we were pleased to see the veteran of so many years' faithful service still hale and hearty, and looking fit for years to come.

On entering the garden we are confronted with the fruit houses—a handsome, substantial range of glass 442ft in length. The first house entered is devoted to the cultivation of Peaches and Nectarines. The trees are planted both at the back and front of the house; those on the front are trained on what is popularly called a drum trellis, thereby allowing a maximum of light and sunshine to reach the trees on the back wall. At the time of our visit the bulk of the fruit had been gathered, but we were informed the crop had been good and the quality first class—a statement which was fully borne out by the few remaining Nectarines which we saw, large, brightly-coloured specimens. Three houses in all are set apart for the growth of these luscious fruits, large quantities being annually required to supply the dessert table, especially Nectarines, which are specially favoured by Sir Michael.

The trees, which are models of good training, are all in excellent health, free from insect pests, and promising well for next year. In the early house the trees are on the front only and trained up the roof, the back wall being covered with two fine *Lapagerias*, a red and a white. The fine, strong growths and leathery dark green leaves indicate that the position and treatment accorded them are exactly to their liking, and as a recompense they annually yield an abundant supply of their beautifully

A Four-Flowered Tulip.

chaste flowers. The fruit had all been cut from the early Vines, but in the two later houses many fine bunches still remained.

Especially good were the Muscats, of which we observed a goodly number of excellent bunches, with large berries of a beautiful amber tint, despite the sunless season we had experienced. The majority of the Vines at Ardgowan are no youths, having been planted about forty years ago. Mr. Lunt is, however, bringing up young, vigorous canes from the base and gradually removing the old rods, so that, like the proverbial eagle, these Vines may be said to be renewing their youth. The Fig house, which occupies the westmost end of the range, is somewhat narrower in width than the rest of the range, the trees being planted on the back wall only. Two huge trees completely fill the space, and bear splendid crops of fruit. At the time of our visit the second crop was ripening, and we observed many luscious, tempting examples. Mr. Lunt remarked that he thought they were the finest second crop Figs he had had from these trees; the variety is Brown Turkey. Sandwiched in amongst the fruit houses are two plant houses—a greenhouse and a stove. The former was bright with a variety of flowering plants usually found in such houses; a number of large specimen *Camellias* were, however, specially noteworthy, all in robust health and beautifully trained. Amongst them we noticed a couple of nice shapely plants of that fine old sort, *C. reticulata*. In the stove were a nice batch of *Ixoras*, while foliage plants were well represented by well-grown highly coloured *Crotons*, *Dracenas*, *Caladiums*, &c.

Strawberries for forcing are grown in large quantities in pots, and fine healthy stuff they looked as they stood in long rows along the walk in front of the fruit range, and they will no doubt give a good account of themselves next spring. In the kitchen garden the usual vegetables are grown in large quantities to meet the heavy demands that are made upon this department. Specially fine we noticed a large breadth of Onions, sown as late as the beginning of April; yet, notwithstanding the shortness of the season, many fine samples were observed, quite equal to many that have been reared under glass and transplanted.

If we mistake not, Onions have been grown continuously on the same ground for at least a quarter of a century, whatever more. The appearance of this latest crop is such as would refute the theory advanced by some that it is suicidal policy to grow this useful vegetable year after year on the same ground.

Beetroot, too, was very fine, a large breadth, beautifully coloured, with not a single rogue being noticed among them. Brussels Sprouts were also well represented, promising a plentiful supply for winter. Strawberries, we were informed, had suffered

from the late spring frosts, but the deficiency in this valuable crop was amply supplied by a superabundant crop of Raspberries. Mr. Lunt had a word of commendation for that fine variety, "Superlative," a splendid cropper, with fine large berries. A few Gooseberries were still hanging on the bushes, the remnant of an abundant crop, and toward these the ubiquitous blackbirds were paying marked attention.

Passing out of the walled garden we come to a couple of ranges of nice useful span-roofed houses, devoted to the growth of various plants. In the first of these, which we entered, was a nice collection of Azaleas and greenhouse Rhododendrons, all in robust health, and bristling with flower buds. A nice little collection of Orchids in fine healthy condition was also noted. *Calanthes*, which are a speciality at Ardgowan, are grown in quantity, and a splendid lot of plants they were, just beginning to show their flower spikes. We have vivid remembrances still of the brilliant display these useful winter blooming plants made, associated with scarlet Poinsettias, in the long ago. Crotons, *Dracaenas*, *Pandanus*, &c., grown in small pots for table work filled another house, and clean, brightly coloured, useful stuff they were. Ferns, too, are largely grown, especially *Adiantums*, which are much in demand for decorative purposes. Growing in baskets we noted several fine *Davallias*, also the beautiful *Gymnogramma schizophylla*, handsome to look at, but of little utility. *Gloxinias* and hybrid *Streptocarpus* made bright the stages of another house, showing how admirably adapted these plants are for decorative purposes.

The next house we entered was entirely filled with the best and newest varieties of Zonal Pelargoniums in full bloom. Both single and double varieties were represented, making a gorgeous display, that might well make a Cannell or a Pearson green with envy.

A fine batch of Cucumbers growing in pots was next noted. These were just coming into bearing, and are to afford the winter's supply. Melons were just over; the crop, we were told, had been excellent, one of Sutton's new varieties having done splendidly. The name has escaped our memory, but Mr. Lunt considered it the finest variety he had ever grown; surely an excellent testimonial, coming, as it does, from one who has had such a lengthy experience. Tomatoes filled another house, Austin's Eclipse being a favourite, and, as seen at Ardgowan, it would be difficult to eclipse. The plants were loaded with large, handsome fruits, requiring a little sunshine to bring them to maturity.

This being the last of the houses, and as a heavy shower of rain was falling, we were perforce obliged to shelter for a little, and while doing so we naturally spoke of the bygone days, and those who were associated with us in these gardens then. If these lines should meet the eye of someone who has spent a term at Ardgowan under Mr. Lunt's superintendence, we can most heartily assure them that their old chief continues to take a most kindly interest in their welfare still, rejoicing to know of their success. On leaving our hospitable shelter we observed that a wall which was formerly devoted to the growth of Pears—which, however, never did satisfactorily—had undergone a change. The trees had been recently removed, and the space planted with fine varieties of Tea Roses. This will no doubt be a great improvement once the trees become established, giving a plentiful supply of Roses for house decoration, large quantities of cut flowers being in constant demand for this purpose.

There are many more things of interest which might be noted in these interesting gardens, where high culture and tidiness prevail on every hand; but we fear, Mr. Editor, we have already trespassed too much on your valuable space. We cannot, however, close these rambling notes without expressing our thanks to Mr. Lunt for his kindness and courtesy in thus enabling us to spend an enjoyable hour amidst familiar scenes, an hour which will long remain a pleasant recollection in the memory of—  
ALBYN.

#### South Africa.

The following extracts are from a letter from Pretoria, Transvaal:—"We have been having very warm weather lately, much warmer than we ever have it at home. The sun seems to be direct overhead, and so near that it almost scorches everything. One great peculiarity of this country is the clear atmosphere; things that seem about fifty yards away, on examination will prove to be nearer a mile. Mountains can be seen plainly at sixty and eighty miles on a clear day, and I believe much further than that. [Forty miles is about the usual distance at which one can see hills.—Ed.] South Africa, at least all I have seen of it in an eight-months sojourn in three of the Colonies, is very hilly, and bare of wood of any kind; in fact, the whole country, in my opinion, is as barren and dreary-looking a place as any one could wish for. This is a terrible country for thunderstorms, and we are about to have one to-night. The lightning is almost incessant, and the atmosphere is so stuffy one can hardly breathe; the thunder seems to shake the very ground.—Oct. 21, 1902."

## Societies.

### Royal Horticultural Society, Drill Hall, December 9th.

The last meeting of this Society for the year 1902 was a small one, owing largely to the very cold weather. Four nice collections of Apples were forwarded, and Messrs. Wells and Co., Limited, were strongly represented with Chrysanthemums. Cypripedium groups were noticeable. At the afternoon meeting nearly fifty new Fellows were elected. The new hall plans furnished a topic for criticism amongst members at this meeting.

#### Orchid Committee.

Present: Harry J. Veitch, Esq. (in the chair); with Messrs. James O'Brien, de B. Crawshaw, H. Ballantine, F. A. Rehder, Norman C. Cookson, H. T. Pitt, W. H. White, A. Hislop, F. W. Ashton, E. Hill, Jas. Douglas, J. W. Odell, F. J. Thorne, W. Boxall, W. H. Young, J. Charlesworth, J. Wilson Potter, T. W. Bond, H. Little, and J. G. Fowler.

W. E. Budgett, Esq., Henbury, Bristol, staged a group of Cypripediums in flower, and the plants were in a very vigorous state of health. Here was included *C. Leeanum giganteum*, *C. Leeanum Budgett's* variety, the latter's pouch being more protruding and of a lighter colour than in *giganteum*. A plant of *C. insigne* in a comparatively small pan bore nineteen flowers. Other fine varieties were *C. Swinburni magnificum*, *C. Leeanum Keeling's* var., with prettily mauve tinted dorsal sepal; *C. i. Essie Budgett*, and *C. i. The Queen*, amongst others. The latter is a very prettily coloured flower. A very bright display.

Messrs. J. Veitch and Sons, Limited, Chelsea, S.W., contributed a select group of various hybrid Orchids. *Laelio-Cattleya Semiramis* is both a graceful and richly coloured flower; *L.-c. x Hon. Mrs. Astor* is of a buff-tea colour, with a nicely shaded purple lip, a charming subject; *L.-c. x Omen*, with prettily acuminate segments, of a pale mauve-purple hue; *L.-c. x Coronis*, with deep cinnamon coloured sepals and petals, and reddish lip, together with various Cypripediums, particularly good being *C. x Aetæus* and *C. Euryades Langleyense*.

Messrs. Hugh Low and Co., Bush Hill Park, Enfield, had a small group, in which we noted *L.-c. Whateleyor*, of the *C. Iris* type, stout and interesting. The lip is very handsome—a velvety maroon. They had a finely flowered plant of *Dendrobium aureum*, and another of *Cymbidium Traeeyanum*. Their *Oncidium cheiroporum*, with five showy panicles, was decidedly good. Norman C. Cookson, Esq., sent some beautiful hybrid Cypripediums.

O. O. Wrigley, Esq. (grower, Mr. E. Rogers), The Gardens, Bridge Hall, Bury, had an exceedingly creditable collection of Cypripediums, bearing immense flowers of really fine colour; they were remarkable, too, for their floriferousness. *C. nitens magnificum* was superb, and the following were also above par: *Arthurianum*, *Antigone* (one of the *Godfroyæ* group), *Leeanum Clinkerberryanum*, *insigne Berryanum Sallieri*, *i. punctatum violaceum Euryades*, a large flower; and *i. Laura Kimball*. The group might contain about 150 to 160 plants, in 5in and 6in pots.

#### Floral Committee.

Present: J. Jennings, Esq. (in the chair); with Messrs. H. B. May, Geo. Nicholson, R. Dean, E. Molyneux, J. F. McLeod, James Hudson, W. Howe, Chas. Dixon, W. Bain, H. J. Cutbush, Chas. E. Pearson, H. J. Jones, R. C. Notcutt, Chas. E. Shea, W. P. Thomson, E. H. Jenkins, J. W. Fitt, C. Blick, Harry Turner, F. Page Roberts, and Chas. T. Druery.

Count Seilern (gardener, Mr. W. J. Prewett), Frensham Place, Farnham, contributed Chrysanthemums, including some excellent incurveds.

Messrs. H. Cannell and Sons, Swanley, Kent, were represented by a table of Zonal Pelargoniums in bouquets, these being in glasses. A large number of very excellent seedlings were included. We may name Lord Roberts, deep maroon; Duke of Norfolk, a lighter shade; Duchess of Marlborough, rose-salmon centre, white edge; Lady Laurier, rich salmon-red; Mrs. Brown Potter, deep rosy cerise; Mary Beaton, pure white; and The Sirdar, scarlet. Their incurved Chrysanthemum *Snowdrift* was shown in good form. Messrs. Barr and Sons, King Street, Covent Garden, W.C., sent Barr's Extra Early White Roman Hyacinths; also Rosy Gem variety, and *Mitchella repens*, a hardy little trailer with crimson-scarlet berries.

Messrs. Wells and Co., Earlswood Nurseries, Redhill, Surrey, made quite a wonderful display of Chrysanthemums, filling more than half a table length of the hall. We need not name the exhibition flowers here, but would refer to the following decorative sorts: Singles: Mrs. D. B. Crane, Crimson Gem, Herbert Henderson, Ellen Smales, Kate Williams, Dorothy, Yellow Jane Improved, Yellow Giant, Golden Star, Nora, Mrs. E. Brigg, Lady

Windsor, Framfield Beauty, and Pretty. Of the thread-petalled sorts there were Mrs. J. Carter, Novelty, White Jitseyetric, Sam Caswell, and Mrs. W. Butters. This group was quite one of the leading features of the show.

Mr. H. B. May, Dyson's Lane Nurseries, Upper Edmonton, staged foliage plants, Ferns, and Carnations. Of the latter there were Prince of Wales, Mrs. Moore, Resplendent, Mrs. T. W. Lawson, and Monarch. A. Seth Smith, Esq., Silvermere, Cobham (gardener, Mr. J. Quartermain), sent a basket of *Freesia refracta alba*; these were delicately scented.

Messrs. W. Cutbush and Son, Highgate, London, N., sent a wonderfully bright collection of tree Carnations. The size and colour of them was exceedingly good. We may again name Sir Hector MacDonald, Lady de Ramsey, America, Mrs. S. J. Brookes, and Gov. Roosevelt. Messrs. Thos. Rochford and Sons, Turnford Hall Nurseries, Broxbourne, contributed a group of very well grown Begonias Gloire de Lorraine and Turnford Hall. From Messrs. J. Veitch and Sons, Limited, Chelsea, came winter flowering Begonias, and the pretty *Jacobinia chrysostephana*, which we figure this week. Of the Begonias, Winter Cheer was well shown, together with Julius, Ensign, and Agatha. Messrs. Wm. Bull and Sons, 536, King's Road, Chelsea, contributed a number of huge *Encephalartos*, *Zamias*, and *Ceratozamias*. They had also *Hydrangea speciosa nivalis*.

Miss Easterbrook, Fawkham, Kent, had a beautiful decorated basket of single and thread-petalled white Chrysanthemums.

#### Fruit and Vegetable Committee.

Present: H. Balderson, Esq. (in the chair); with Messrs. Jos. Cheal, W. Bates, S. Mortimer, Alex. Dean, Edwin Beckett, Wm. Fyfe, Horace J. Wright, Geo. Kelf, P. C. M. Veitch, H. Somers Rivers, H. Markham, J. Jaques, F. Q. Lane, Geo. Wythes, James H. Veitch, W. Poupert, and Henry Esling.

The Hon. C. Harbord (gardener, Mr. Allan), The Gardens, Gunton Park, Norwich, sent a fine collection of Norfolk Beauty Apple, the fruits large, deeply coloured, and clean.

Messrs. T. Rivers and Son, Sawbridgeworth, sent twenty-one baskets of fruits, some of these being orchard-house samples. Emperor Alexander, Belle de Pontoise, King of Tomkins County, Melon Apple, Cox's Orange Pippin, and Peasgood's Nonesuch, with Gloria Mundi, Gascoigne's Scarlet, and Annie Elizabeth, were each very handsome.

R. W. Whiting, Esq., from Credenhill, Hereford, sent Apples, among them being the varieties James Grieve, Golden Spire, Cox's Orange Pippin, Egremont Russet, Golden Noble, King of the Pippins, Newton Wonder, Worcester Pearmain, and Lane's Prince Albert.

Messrs. J. Cheal and Sons, Lowfield Nurseries, Crawley, had a very large collection of Apples, and we noted excellent samples of Paroquet (recent), Newton Wonder, Lord Derby, Golden Spire, Crawley Reinette, Lane's Prince Albert, Wyken Pippin, and Atalanta, together with some Pears.

Apples were staged in tasteful form by Messrs. H. Cannell and Sons, of Swanley. Their Peasgood's Nonesuch was good; so, too, their King of the Pippins, Cellini, Dutch Mignonne, Beauty of Kent, Bramley's Seedling, Worcester Pearmain, Annie Elizabeth, Alfriston, Blenheim Orange, Lady Henniker, Lane's Prince Albert, and New Hawthornden, all of which were from field-grown trees.

#### Awards of Merit.

*Boucardia, King of Scarlets* (John Robson). A variety remarkable for the strength of its eymose clusters and scarlet-crimson. (Award of Merit.) From Rowden Nurseries, Altrincham.

*Primula obconica semi-plena* (Sir T. Lawrence, Bart.). A mauve-purple coloured, semi-double variety. Award of Merit.

An apple from Mr. H. H. Raschen, Sidcup, Kent, received an Award of Merit, but none of the fruits were to be found.

#### Medals.

FLORAL COMMITTEE.—Silver-gilt Banksian, for group of winter flowering Begonias to Messrs. J. Veitch and Sons, Chelsea. Silver Flora, for Chrysanthemums to Messrs. Wells and Co., Redhill. Silver Banksian, for Begonias to Messrs. T. Rochford and Sons, Broxbourne; for Carnations to Mr. H. B. May, Upper Edmonton; for Zonal Pelargoniums to Messrs. Cannell and Sons, Swanley. Bronze Flora, for cut Chrysanthemums to Count Seilern, Farnham.

ORCHID COMMITTEE.—Silver Flora, for group of Orchids to W. E. Budgett, Esq., Henbury, near Bristol; and to Messrs. J. Veitch and Sons, Chelsea. Vote of Thanks to Messrs. Hugh Low and Co., Enfield. Silver-gilt Flora for group, and Cultural Commendation for *Cypripedium Arthurianum*, to O. O. Wrigley, Esq., Bridge Hall, Bury.

FRUIT COMMITTEE.—Silver Knightian to Messrs. Cannell and Sons, Swanley, Kent. Silver-gilt Knightian to Messrs. Thos. Rivers and Son, Sawbridgeworth, Herts; to Col. Hon. C. Harbord, Hereford. Silver to R. W. Whiting, Esq., Norwich.

### Potatoes at the Cattle and Root Show, Birmingham.

Considering the exigencies of the season, Potatoes were extremely well shown at this show, whilst roots, such as Mangolds and Turnips, were even larger; but there was a tendency to sacrifice quality to size, doubtless occasioned by the extraordinary prevalence of dull and rainy weather during the growing season. In the trade exhibits Messrs. Webb and Sons, Wordsley, Stourbridge, had, as usual, a grand representation of Mangolds, Swedes, and Turnips. With new Potatoes not yet offered for commerce, Mr. F. Williams, Thornbury, Gloucestershire, was placed first with a variety which is appropriately named after the year of its birth, "1902." It is a very handsome white, nearly round, with a fine skin. The second prize was annexed by Mr. G. S. Willes, Farnborough, with another appropriately named variety, Coronation. This also is a handsome and not too large white, round tuber of ideal size. The veteran Satisfaction, as usual, was prominent in the competition classes, and its compeer, Mr. Breese, occupied a similar position. Appended is a list of a few of the principal prizetakers.

For twelve varieties, distinct, that champion exhibitor, Mr. D. H. Wells, Tysoe, Kington (who had twenty-three entries), annexed the first prize with fine examples of New Majestic, a white round, of perfect shape, Reading Russet, Progress, Lord Tennyson, Supreme, Edgecote Purple, Goldfinder, Mr. Breese, Satisfaction, The Dean, Empire, and Purple Perfection. Second, Mr. B. Parker, Scotforth, Lancaster, with a somewhat smaller lot as regards size of tuber. For six varieties, Mr. Wells again asserted his superiority by annexing the first and third honours, whilst the second prize fell to the Duke of Portland, Welbeck Abbey. The first prize collection contained Mr. Breese, Progress, Lord Tennyson, Goldfinder, Edgeworth Seedling, and Satisfaction; a capital lot. For four varieties, two white and two coloured, Mr. Wells was again to the fore with Lord Tennyson, Satisfaction, Mr. Breese, and Motor, the latter a handsome medium-sized white variety of Up-to-Date contour. The second prize fell to Mr. F. Williams, Thornbury; third, Mr. D. H. Wells. For four varieties most suitable for field or farm culture, Mr. Wells was the victor with very good specimens of Ideal, Motor, Reading Giant, and Satisfaction; also second with Reading Giant, Satisfaction, Sutton's Abundance, and Commonwealth; third, Mr. Thomas Penn, Worminghall, Thame.

In the class for two varieties, long or kidney shaped, Mr. B. Parker scored with Satisfaction and Lord Roberts, a long, white kidney; second, Mr. F. Williams, with Mr. Breese and Ideal; third, Mr. D. H. Wells. For two round varieties, Mr. F. Williams won with Pink Perfection and Satisfaction; second, Mr. B. Parker with Satisfaction and General Buller, the latter a shapely, medium-sized white variety; third, Mr. Thomas Penn. For one long or kidney-shaped variety, Mr. Wells was to the front with a fine dish of Satisfaction; second, Mr. F. Williams with a handsome dish of Mr. Breese. For one round variety, Mr. Thomas Penn was first with Webbs' Goldfinder; and Mr. F. Williams second with Satisfaction. For the most handsome dish, any variety, Mr. F. Williams was adjudged the first prize with Satisfaction; and Mr. S. T. Parker, Scotforth, second for Daniels' Sensation, a medium-sized round white. For the best new variety not yet offered in commerce (twelve tubers) Mr. F. Williams triumphed with "1902," already described, and Mr. E. S. Willes, Farnborough, for Coronation. There were several other new varieties, apparently more or less worthy of attention.

### Liverpool Horticultural.

On Saturday evening, the 6th inst., a large attendance of members met together to hear Mr. Francis Ker's (Aigburth Nurseries) discourse on "Bulbs and Plants for Early Forcing." This gentleman treated the subject in a masterly manner, emphasising the importance of having good plants, which have been well grown and ripened the previous summer. He advocated, in the case of early Tulips, that they should be forced under stages, and covered with mats, and also laid great stress upon the selection of suitable varieties. His selection was acknowledged to be a good one, and included the favourite sorts of Tulips, Hyacinths, &c. Other suitable plants to keep up a regular and continuous supply were Freesias, Narcissus, Lily of the Valley, Spiræas, especially the new shrubby variety Anthony Waterer; Azaleas, mollis and indica; French Lilacs, Tea Roses, Deutzias, Liliums, Hydrangeas, Wistaria sinensis, and many other subjects. A good discussion followed, in which Messrs. B. Ashton, Sherry, Mercer, and Haynes took a leading part. Lily of the Valley was the theme for the exchange of various ideas, and it was acknowledged that sphagnum moss was the most suitable material for covering these crowns; and also that retarded crowns be grown, some of the members having flowered these in a period of eight days. Mr. Haynes, Birkenhead, brought for inspection some Amaryllis bulbs which had been grown outside, and which caused considerable comment. A vote of thanks to Mr. Ker for his admirable paper and Mr. Foster for presiding terminated the meeting.—J. S.

### Birmingham Gardeners' Association.

The usual fortnightly meeting was held on the 1st inst. with Mr. Walter Jones (the vice-chairman of the Association) presiding. A short essay on "Cool House, Intermediate, and Stove Orchids," by Mr. H. A. Burberry, late Orchid grower to the Right Hon. Joseph Chamberlain, Highbury, was read. The essayist's practical remarks and advice were much appreciated, and also enhanced by a series of lantern slide representations of Orchids grown by Mr. G. H. Thompson, Grove House, Walsall. The photographs had been executed by Mr. Thompson's son. At the conclusion of an ensuing interesting discussion, a hearty vote of thanks, conjointly to Messrs. Burberry and Thompson, was proposed by Mr. W. Gardiner and seconded by Mr. George Stacey, and carried unanimously. Mr. G. Stacey was awarded a Certificate of Merit for a collection of medium-sized, bright, and well-coloured Apples.

### Metropolitan Public Gardens Association.

**OPEN SPACES.**—At the monthly meeting of the Metropolitan Public Gardens Association, held at 83, Lancaster Gate, W., Sir William Vincent, Bart., vice-chairman, presiding, it was stated that the laying out of the ground at Southfields was almost finished, and that the tree-planting work in Shoreditch, Islington, and Barking, as arranged at the last meeting, was being taken in hand. Complaints were received as to renewed thinning operations at Burnham Beeches, which were alleged to be unnecessary and of a detrimental character, and it was decided to communicate with the City Corporation on the subject. It was also decided to take part in a deputation to the London County Council to protest against a proposal to alienate the house and upper part of the ground at Golder's Hill for the purpose of a convalescent home, as being quite contrary to the scheme under which contributions were obtained from the public, and to the Act by which the property was placed in the Council's hands. It was agreed to advocate the acquisition of some fields, about nine acres in extent, adjoining a picturesque part of Hampstead Heath, which would be injuriously affected if they were built over, and to take steps to oppose a Bill to be introduced next Session seeking to override the Disused Burial Grounds Act in order to convert a disused burial ground in Dorset Street into a building site. Progress was reported with regard to the Hainault Forest scheme, and the application which the Open Space Societies had recently made to the London County Council for a grant of £10,000 thereto. The subject of the Richmond Hill view was also mentioned in connection with the alleged undertaking given by Sir J. Whittaker Ellis to restrict building operations on certain property owned by him comprised in the view. It was reported that the Duke of York's School, Chelsea, was likely to

be removed from its present position, and it was agreed to make endeavours to prevent at least that portion of the site which contains fine trees from falling into the hands of the builder.

### R.H.S. of Perthshire.

The annual general meeting of the Royal Horticultural Society of Perthshire was held at Perth on Saturday afternoon. Mr. Henry Coates, Pitcullen, the president, occupied the chair, and there was a good attendance. The annual report and financial statement was submitted, from which it appeared that the society had suffered considerable financial loss through the railway accident on the Perth and Edinburgh line at Hilton Junction, whereby the side shows belonging to Mr. White were so much damaged that they were unable to be forward at the annual exhibition. As a result of the want of these attractions, the drawings had suffered to a large extent, but, notwithstanding, the society had a balance on the right side. The following office-bearers were elected: President, Mr. Henry Coates, Pitcullen; vice-presidents, Mr. Rufus D. Pullar, Brahan; Lord Provost Love; practical vice-president, Mr. Stenning, The Gardens, Brahan; secretary and treasurer, Mr. A. W. Brown; and a directorate of fifteen, composed of gardeners, amateurs, and nurserymen.

### Ipswich Mutual Improvement.

At the last meeting of this society, on December 4, Mr. W. Close, Holy Wells Gardens, the energetic secretary of the society, read a most valuable paper on "Tree and Malmaison Carnations." Mr. Close devoted most attention to the Tree Carnations, which he said were a class of plants rapidly coming to the front. To ensure strong plants for winter flowering it was essential that an early start should be made. Cuttings of short-jointed side growths should be inserted in January in pots of sandy soil, which should be placed in a propagating frame having bottom heat. When rooted, pot off in 54's, stopping the plants when 5in high. Shift into flowering pots (32's) in June, and stand the plants in an open situation, stopping the growths once or twice during the summer. House the plants in September in a light greenhouse, affording plenty of air at all times, except during severe frost. The essayist also gave minute cultural directions for Malmaisons, and then proceeded to refer to the best varieties in each section. He had a fine collection of cut flowers of Tree Carnations on view, some grown by himself, and others supplied by Messrs. Cutbush and Son, Highgate. Amongst others, we noted nice flowers of S. J. Brooks (good white), Viscount Kitchener, Harry Fenn, Shazada, Novelty, Lord de Ramsey, Hector Macdonald, and America. A good discussion followed, which was terminated by Mr. Morgan proposing a hearty vote of thanks to the essayist, and to Messrs. Cutbush for their exhibit.—E. C.

## Apple, Royal Late Cooking.

At the meeting of the Royal Horticultural Society on January 14th, 1896, the Fruit Committee granted an award of merit for this Apple. It is one of the seedlings which Mr. Powell raised at Frogmore, but has been long established as a favourite late cooking variety in the Royal household. The fruits exhibited were remarkably fine as the produce of a large standard tree, and were thus not assisted by thinning and feeding as many fruits are, and should be, for developing their fullest size and beauty for exhibition, and, in fact, for market purposes. The best fruit of all kinds pays the best, and attention to the points in culture indicated acts in the same beneficial way in the case of Apples, Pears, and Plums as in Grapes. The fruits of Royal Late Cooking exhibited were what may be termed good ordinary samples. They had some resemblance to Lord Derby, but were more symmetrical, firmer, and heavier. Mr. Bunyard thinks he can detect a trace of Tower of Glamis and Alfriston in the Royal Late Cooking; but, be that as it may, the fruits are fine. The illustration represents a typical example of the variety.

### TRADE NOTE.

**Ware's Nurseries, Feltham and Bexley Heath.**

Mr. Geo. Pike informs us that he has acquired the above business and nurseries, as, and from August 31st, 1902, and that the business will be carried on by a new Company, under the style Thomas S. Ware (1902), Ltd., with Mr. Pike as managing director.

Apple, Royal Late Cooking.

### Beckenham Horticultural.

On Friday, December 5, E. Lovett, Esq., West Burton House, Addiscombe, gave a most interesting lecture on "Insect-feeding Birds, and how to Encourage Them." A good gathering of members and friends of the society, which included some ladies, was presided over by W. Groves, Esq., Grove House, Shortlands, a gentleman who, by the way, for a great number of years has studied bird life, &c. The lecturer particularly emphasised the fact that he did not advocate the killing of anything, though in speaking of the house-sparrow he agreed that we had too much of him, and suggested that food should not be thrown out as is usually done in bad weather, but rather let the sparrow shift for himself, and study the wants of the insect-feeders by suspending from branches of trees, by a string, pieces of fat meat, suet, bones, &c. (not ham bones). The lecturer pointed out that the sparrow could not get a foothold on this suspended food, whereas the tits, &c., could do so. It was suggested by the lecturer that stacks of faggots should be built at convenient spots in fruit orchards to encourage the nesting of the insect-feeders. Suitable boxes also were advised (one on view), and the steps to be taken to frustrate the efforts of cats to reach them. At the close the chairman made some instructive comments on the lecture. Several questions were asked, after which hearty votes of thanks were accorded the lecturer and chairman. It was understood from Mr. Lovett that his views on the bird question will be printed and published, so we may be able to read him in extenso. The L.C.C. have carried out with success suggestions made by Mr. Lovett.—T. C.

### Cardiff Gardeners' Association.

The fifth annual general visit to the Central Free Library took place on Tuesday, December 2, Mr. A. Pettigrew, F.R.H.S., in the chair. A good muster assembled, and were received by Mr. John Ballinger, the chief librarian. The object was to view the large collection of books relating to horticulture, and noticeable again were numerous additions since the last visit. One word may be said, and that the librarian never misses an opportunity of securing a good thing when once he thinks it will be of some value to the public, and the chief and most considerate fact is, that it is the most valuable is secured, knowing full well that they are out of reach of the average gardener and amateur. Three very costly works have been purchased quite recently, viz., "Humming Birds" and "British Birds," both dealing in reference largely with the Orchids, showing how skilfully the methods of fertilisation are carried out. Thirdly, the "Reichenbachia" has been much sought after since its introduction. After a couple of pleasant hours had been spent, the chairman, addressing the meeting, referred to the many chances the young gardener of to-day had against his predecessors of some thirty years ago. A very hearty vote of thanks was accorded Mr. Ballinger for his kindness in being instrumental in obtaining the invaluable books for the benefit of gardeners and amateurs generally. In replying, this gentleman spoke at some length upon some of the rarest and most expensive works, and said he felt keenly the appreciation of the members by the way the books had been taken up in the library between the times of each visit. A very cordial vote of thanks was given Mr. Pettigrew for presiding.—J. JULIAN.

### Young Gardeners' Domain.

#### Maximus in minimis.

The Napoleons of horticulture were not born great. Even under its commercial aspect the founders of great firms, whose mantles have descended perhaps to the second or third generation, often started in the humblest manner to win a name and fame as providers for the great gardening world. Most of the latter, indeed, were private gardeners, whose modest capital, enabling them to secure a foothold on the great commercial ladder, was gleaned by thrift in the first field of their labours. There they stand, however, in person, or in memory, towering far above their fellows, pointing the beacon-finger of example to all who aspire. It is easier, certainly, to see the heights they have attained than to follow a course which, beginning on obscure lines, only opened into the broad road of success when near the summit. "Oh! it's grand to be on top," some youthful aspirant will say. It is, my boy: remember the Marshals of France who, as private soldiers, carried their bâtons in their knapsacks. Remember, too, our text, *Maximus in Minimis* (great in little things): surely a grand motto for lads starting in life. Simple words, truly, but pregnant with persistent perseverance, stern application, rigidity of character, power to attain and maintain, full recognition of the grandeur of duty, the resolve to do, and the will to do it.

There is a great wild cry about bad bothies, long hours, and low wages. Our boys are told that they want baths, reading-rooms, recreation grounds, cricket pitches, ping-pong perhaps, and what not. Naturally they believe it, for are they not good

things in their way? In their way, I grant you; but none of them had aught to do with elevating the Napoleons of horticulture. The Fates forbid that any disparagement of betterment in the bothy be suspected; none is intended. For such good things, and others of that ilk, as aids to elevation, the writer rests under the calm neutrality of indifference. The absence of them provides no excuse for failures in life. Let our boys enjoy the bothy bath if—if they can get it, and when taking up positions as head gardeners they will, doubtless, soon get over the want of it where such luxuries (necessities in the bothy) are practically unknown. One gardener's house in England is certainly known to possess its bath; possibly another may be so provided, but as head gardeners are not prone to agitate for themselves, the "Missus" wash-tub will, doubtless, still do duty for a weekly ablution subsequent to the sousing of the olive branches.

The cause of the young fellows is being bravely championed by old boys in the most unselfish manner; so much so that, at first sight, it appears more creditable to their hearts than to their heads. Where is the young gardener who could but think that the change from rich, luxurious lodgings, recently depicted as furnished by a modern bothy, to the poor accommodation of many a head gardener's cottage—house, if you will so miscall it—is a step on the down grade? There is no wish, however, to trench on old boys' ground, provided they do cock up the young fellows with imaginary grievances. One thing by the way, viz., those who plan, or who offer prizes for plans of up-to-date bothies, seem to have overlooked the chief factor in their erection; that is, their suitability to the position, and, I take it, the bothy should be—must be—subordinate to the garden, unless placed outside of it, in which place the grounds have to be considered. There are many gardens in which a two-storied building would be totally unsuitable by its obtrusiveness, and the writer spent four years in one palatial erection, sadly missing that homeliness and privacy which the old-fashioned bothy, with all its faults, gave. Things are not always what they seem, and about our lodgings there were two opinions, one held by us bothyites, as we bolted like rabbits by the back door when visitors were shown in by the elegant front entrance, with its Gothic porch and spotless tiles, specially reserved for them, and were loud in their praises of what they saw. To the young fellow who has the real gardening grit, whose course is well planned and undeviatingly pursued, neither bad bothies, nor good bothies, hard work, or poor pay, the want of help, or absence of pity, will prevent him reaching his goal. All such things to him are little things, contemptible little things, to which our text does not apply, for there is nothing great in them or ever will be.

All unconsciously these thoughts have strayed to the bothy, running the writer from the text, but that cradle of the gardening race must not monopolise; rather is it in the common round, the daily task of gardeners launched on the ocean of life that one may note how great some men are in little things, and how others treat them with supreme contempt. There is no better field of observation than that afforded by a flower show where the two types stand out conspicuous under the glare of competition; the one calm, methodical, and dignified, the other all flurry, flutter, and fuss. In the coming Chrysanthemum shows may be found excellent illustrations to our text, and a critical eye can focus retrospectively the full career of the winner from the cutting to the cup. A hundred trifles have been grasped in co-relation to the main ethics of sound culture, culminating in the last dainty touches of a deft hand to the beloved blooms. In these days of keen competition by great growers there may be, really, but little or no difference in pots, soil, position; or feeding beyond that which constitutes greatness in little things, and so on with the Goliaths of Grapedom, the Princes of plant culture, and all the attributes which make a man stand out among his fellow-men, the more conspicuous by his unostentatious manner, and a certain air *Je ne sais quoi*, but emphasising how good, yea, even noble, it is to be great in little things.

*Maximus in Minimis.* By its means men in obscure positions, with but small and ordinary gardens under their care and keep, gradually, perhaps unconsciously, place themselves and their work on a pinnacle of fame in the gardening world. Doubtless, the bulk of British gardeners do very well, performing their work creditably, and doing what they are paid for. They, of course, grumble more or less, but are really very happy withal; yet now and again one good man amongst this mass of good men cannot rest content with doing very well when he feels that he can do better. It is not for him, however, to march free and easy on a Royal road to eminence. In the by-paths he is to be found ever advancing, ever seizing every opportunity to learn in labouring on to a desired, but always receding, goal, for 'tis given to no man to reach finality in gardening, but 'tis the prerogative of the gifted few to better understand that benevolent yet capricious mistress, Nature. To them she reveals her little things which, in the aggregate, are the secrets of success. Nature, herself, is great in little things; the pupils she loves could not be otherwise.—A. N. OLDMEAD.

### Hardy Fruit Garder.

**WINTER PRUNING OF FRUIT TREES.**—The winter season affords the best opportunity for examining fruit trees in general and cutting out or shortening back superfluous wood. The main object of pruning must be to promote a fruitful habit, and this can only be done by well balancing the growth, and concentrating the energy of the trees in the production of wood, which shall tend in due proportion to form fruit buds as well as wood buds. Winter pruning is one of the important means by which fruitfulness is brought about, but it may, if abused, be also the means of rendering trees unfruitful. In the case of restricted trees, winter pruning is the completion of a method which was begun in summer. When winter pruning only is adopted in the management of formally trained specimens fruitful results are not always so certain. For free growing trees winter pruning usually suffices to maintain them properly fruitful, because there is not, or should not be, the hard cutting back, but the simple thinning out of branches.

**RESTRICTED FRUIT TREES.**—A tree originated with a very short stem, from which spring a number of branches, each of which is a separate or independent cordon, is termed a trained bush. The main thing is not to crowd these separate branches too closely together, or, if they are crowded, the winter pruning season should be taken advantage of to thin them out to a distance not less than a foot from each other. Both Apples and Pears are grown in this form, and prove profitable. The winter pruning consists in shortening the current season's shoots, which at this season ought not to be their full length, but have undergone the process of summer pruning. Whether the latter treatment has been accorded them or not, prune now to two or three buds, these eventually forming spurs. Aged trees may require further treatment in the shape of reducing the length of elongated, and thinning out weakly or crowded spurs. Young trees in the course of formation have the leaders shortened one-third of the present season's growth. In fully formed branches the same as side shoots.

**OPEN BUSHES.**—These are usually free growing trees, not trained in a formal manner, but allowed to extend in a natural way, and regulated by the usual process of keeping the branches and growths thinly disposed. Cross branches may be cut out and the centres left open. As a rule, they are encouraged to form natural spurs rather than artificial by not practising any shortening. The thin disposal of the branches so admits light and air that the trees readily do this and continue fruitful. When it is necessary to curtail the size of the bush in any way, it is best to adopt thinning out, and manage the trees more like the head of a standard, which they resemble in most respects, except length of main stems below the branches.

**PYRAMIDS.**—Pyramid trees, chiefly Apples and Pears, are useful forms for restricted spaces and small gardens. The branches are more or less originated horizontally from a central stem all round the trees, the lower ones being the longest. They are not necessarily restricted to a single cordon branch, but may fork, though they should not crowd. A considerable amount of pruning is necessary in order to suppress superfluous wood and keep them fruitful and shapely. Root-pruning periodically is a great help to them, as it encourages fibrous rooting and discourages strong growths. Summer pruning is imperative, and the winter practice must be to shorten these to one or two buds. Old established pyramids which have become crowded require, first of all, the thinning out of branches, then spur growths, which must also be reduced if too long.

**HORIZONTALLY TRAINED.**—Pears are best adapted for this method of training mainly on walls. The great mistake is frequently made of allowing the branches to be crowded. Also, when there are elongated spur growths, and these, too, are thickly placed, the trees are, or shortly will be, unfruitful. Thin the branches to not less than a foot apart. When there are any signs of superabundant growth there must be root-pruning to check it. The current year's shoots, which should be summer pruned, are often left at full length until winter. This is not good practice, as strong growths are almost certain to follow instead of fruit buds. Prune to two buds and look over the trees to see whether there are any weakly parts which may be dispensed with.

**STANDARDS.**—Standards are best grown on the free extension principle, giving each tree ample room to grow, when the pruning will resolve itself into the removal at various times of crowded branches. Those that cross one another, or crowd the

interior, are best cut out, always at their union with larger branches. Maintain, also, symmetrical and shapely heads by judicious pruning.

**CORDONS.**—To maintain cordons in a fruitful, well balanced condition, the summer pruning must not be neglected, and root-pruning should take place when too strong roots are produced. The winter pruning consists in pruning the shortened current year's shoots to one or two buds, these being in a fair way to become fruit buds. It is desirable to keep the fruiting spurs as near the main stem as possible; therefore, when in old cordons these become elongated, it is desirable to gradually shorten them back.—E. D. S.

### Fruit Forcing.

**CUCUMBERS.**—The weather, dull and foggy, has not been in favour of winter fruiterers, and the plants have suffered in consequence. Use warm soil, sweet, and not very wet, for earthing over the roots as they show at the sides of the ridges or hillocks. A few sweetened horse droppings spread on the surface, and a little superphosphate and sulphate of potash, mixed with soot, sprinkled on them, will attract the roots and afford nourishment to them when watered. This is preferable to liquid manure. Unless the plants are growing in limited borders, boxes, or pots, copious supplies will be necessary. Always apply it weak and tepid, and not too often. Sufficient moisture will be secured by damping the floor and walls in the morning and afternoon of fine days, but avoid excessive moisture, and do not supply water to the roots till the soil is becoming dry, then afford a thorough supply.

Look over the plants at least once a week for stopping, removing bad leaves, thinning as required, but pinching and thinning will not be required to a great extent, yet both must be attended to, as crowding is a great evil in the growth of winter Cucumbers. Overcropping is a still greater malpractice, and allowing the fruits to hang needlessly after they attain a size fit for cutting serves only to weaken the plants, and prevent other and younger fruits from swelling, but when large enough the fruits keep several days if the ends are inserted in saucers of water in a place safe from frost. Ill-shaped and superfluous fruit should be removed as they appear, and tendrils and staminate blossoms answer no useful purpose; therefore, remove them. Sometimes, however, it is necessary to fertilise the pistillate flowers to make sure of the fruit swelling, and though this may give a "knobby" fruit, it is better than none at all. Fertilisation, however, is seldom necessary for healthy plants raised from fresh seeds.

**PEACHES AND NECTARINES: EARLIEST HOUSE.**—To have ripe fruit in May of the standard forcing varieties, such as Hale's Early, Stirling Castle, Dymond, Royal George, and Grosse Mignonne Peaches, Early Rivers, Lord Napier, Elruge (some growers prefer Stanwick Elruge), and Humboldt Nectarines, there must not be any further delay in putting on the roof lights and closing the house. The very early Peaches, such as Alexander, Waterloo, and Early Louise, with Advance and Cardinal Nectarines started at the same time, will afford fruit a month earlier under a similarity of forcing conditions; indeed, they may be grown so as to produce ripe fruit in about thirteen weeks from starting, the buds being then well advanced in swelling, as early forced trees usually are, by what is known as "hard forcing." Ripe Peaches and Nectarines in late March and during April bring long prices, and though there are successes the failures are not unfrequent. Growing a few trees in pots is well worth while, as both at table and in the market such very early fruits are highly prized.

Trees started at an early date in previous years swell their buds promptly without much excitement from artificial heat, but those forced for the first time are slower in starting into flower. These must not be hurried, and with the buds swelling and advancing for flowering the atmosphere must not be kept very close, as it is important that the blossoms advance steadily and have time to develop flowers perfect in all their parts. Where the atmosphere is kept close and too moist the blossoms are drawn and weak if the temperature is too high; if low, little progress is made, and the fructifying organs are stunted and effete. Admit a little air constantly at the top of the house, and above 50deg it should be increased correspondingly with the temperature, but not allowing it to decline below 50deg in the daytime, sufficient artificial heat being maintained for that purpose, and with sun heat an advance may be allowed to 65deg, closing for the day before the temperature has receded to 50deg. A temperature of 40deg to 45deg is ample at night, and in mild weather 50deg.

When the flowers are advanced so that the anthers are showing, cease syringing, but afford a moderate amount of air moisture by damping the borders, paths, and walls in the morning and early afternoon of fine days. Avoid a close, stagnant atmosphere at any time, but especially at night with a high temperature. Examine the inside border, making sure that there is no deficiency of moisture. If necessary, afford a copious supply of water or liquid manure. The surface soil is often deceptive,

being kept moist by syringing: therefore, supply enough to moisten the soil through to the drainage, for surface sprinkling does very little good.

Trees often have very weakly blossoms and fail to set in consequence of water being given at the tops instead of to the roots. If there be a superabundance of blossom buds remove those on the under side of the shoots by drawing a gloved hand the reverse way of the growths. This will materially assist the swelling of the remaining buds. If there are any traces of aphides fumigate or vapourise the house on two or three consecutive evenings before the trees are much advanced in colour, always before the petals unfold, and the atmosphere must be dry, or the moisture will be condensed on the cooler surfaces of the flowers, and they will be discoloured or injured.

**SECOND EARLY FORCED HOUSE.**—If the trees are very early varieties, as Alexander, Waterloo, and Early Louise Peaches, with Cardinal and Précoce de Croncels Nectarines, ripe fruit may be had at the end of April or early in May by starting at the new year, but if the trees are second early or midseason varieties, such as Hale's Early, Early Alfred, Dr. Hogg, Rivers' Early York, A Bee, Stirling Castle, Dymond, Royal George, Grosse Mignonne, Crimson Galande, Noblesse, or Alexandra Peaches, Early Rivers, Lord Napier, Rivers' Early Orange, Stanwick Elruge, Elruge, Humboldt, Dryden, Violette Hâtive, or Pine-apple Nectarines, the fruit will not ripen until May is well advanced and during June. This must be taken into consideration by growers. In either case, and the trees not having been forced before, the house should be closed at once, fire heat only being used to exclude frost, the trees being sprinkled occasionally, or on fine days in the morning and afternoon, allowing time for them to become fairly dry before night. Keeping the trees constantly dripping with water, especially at night, enfeebles the blossoms, and is provocative of wood bud rather than blossom bud development. Do not allow the temperature to exceed 50deg in the daytime without full ventilation. Trees previously forced will not need the preparatory treatment, but start readily at the accustomed time. Supply water or liquid manure to inside borders, and protect outside with a few inches thickness of leaves and litter on top to keep them from blowing about.

**SUCCESSION HOUSES.**—Where the roof lights are moveable it is much the better plan to remove them, and expose the trees to the elements for the winter. This is inimical to many insects, and the trees are insured rest and thorough moistening of the border. Trees with thoroughly ripe wood are never injured by the severest weather. Even the latest and unheated houses are best treated in the manner described, often having the effect of causing trees to retain their buds, which cast them under fixed roofs, and the blossoms are generally finer than on the trees that are kept constantly evaporating from the young wood through the time they are at rest under fixed roofs, or where they are subjected to alternating rests and excitements where plants are grown in the house. The fogs and damps of winter, with the drenching rains and snow, suit Peaches on well drained soil, the trees being invigorated and the soil enriched. If the houses have fixed roof lights, ventilate to the fullest extent in all but very severe weather. Proceed with the pruning, bringing matters in respect of cleaning the house and trees to as speedy a conclusion as possible.—ST. ALBANS.

### Meteorological Observations at Chiswick.

Taken in the Royal Horticultural Society's Gardens at Chiswick, height above sea level 24 feet.

| Date.                                 |                    | Temperature of the Air. |           |           |           | Rain.       | Temperature of the Soil.<br>At 9 A.M. |                |                | Lowest Temperature on Grass. |

With the exception of one day (Tuesday, 3rd), the weather during the past week has been very cold and cheerless.

\* \* \* All correspondence relating to editorial matters should be directed to "THE EDITOR," 12, Mitre Court Chambers, Fleet Street, London, E.C. It is requested that no one will write privately to any of our correspondents, seeking information on matters discussed in this Journal, as doing so subjects them to unjustifiable trouble and expense.

**BACK NUMBERS (H. S.).**—We do not remember any special articles on the subject to which you refer, in our last volume, and time is much too precious for us to search through each issue.

**HEATING GLAZED VERANDAH (W. G.).**—For heating the verandah, not more heat being required than sufficient to keep out the frost, a portable hot water apparatus, oil being used as fuel, would suit. The "Reliable Hot Water Boiler," with product pipes over water pipes, thus utilising all the heat of burners, is the most likely to answer your purpose. It is made by W. Cooper, Limited, 751, Old Kent Road, London, S.E., who would give estimate on your stating dimensions of verandah, with rough ground plan as submitted to us.

**PLUM TREE GUMMING (H. J.).**—Gumming, or the exudation of sap, arises from a variety of causes; in your case it is probably as you suggest, the result of the summer, assuming that your trees are not excessively vigorous. Like yourself, we have known fruit trees much injured by shooting bullfinches in them, and you afford evidence that practice is not necessary in reducing the number of these birds, since you have entrapped fifty-eight of them this autumn. Perhaps if you were to describe your method it might be useful to others.

**MANURES (H. S.).**—The chief constituents in chemical manures are nitrogen, potash, and phosphoric acid in the shape of sulphate of ammonia or nitrate of soda, muriate, nitrate, or sulphate of potash; and superphosphate of lime or bonemeal. The advertised fertilisers contain those constituents blended better than you can probably blend them yourself, and are used by most of the leading cultivators. Urine contains all those ingredients. It is excellent as a manure, but must only be given to plants when growing, and in a diluted state. One of the most fertilising of liquid manures is composed of Cabbage leaves and other vegetable refuse, putrefied in the urine from a house or stable, and diluted with three times its quantity of water when applied. If mixed with bleaching powder (chloride of lime) there will be no offensive smell. Gypsum mixed with it, or a little oil of vitriol poured in, adds to its utility as a manure, as it prevents the escape of ammonia during putrefaction. Instead of adding three times the quantity of water, it would be safer with more than twice that quantity for the majority of plants in pots, and then would not benefit all, regardless of kinds, root action, and soil. If you will send your postal address we will endeavour to answer your other question.

**SCALE ON PEACH TREES (H. G.).**—The brown scale infesting Peach and Nectarine trees, *Lecanium persicæ*, does not, so far as we are aware, "descend to the earth" in winter, but it passes that period in the egg state beneath the scale, and in the spring hatches out, being a small whitish woodlouse-like creature, and after a few days fixes on a part of the bark, through which it pushes its beak, and by means of which it abstracts nourishment from the tree, and grows, and forms over itself a scale-like covering, hence the term scale. It is not easily destroyed in the winter time, simply because the eggs are not reached by an insecticide, or, if reached, not killed. The best time to assail the pest is in the spring time, or when the fruit is set and commencing to swell, then syringing, or, for economy of material, spraying, with paraffin emulsion, 6oz to three gallons of water, and repeat at intervals afterwards. As a winter dressing, 4oz of commercial caustic soda may be placed in a bucket half filled with water and 3oz of pearlash added, stirring until dissolved, then dilute to four gallons with water. Meanwhile, dissolve 4oz of softsoap in a little hot water, and when dissolved add to the four gallons of caustic alkali solution, and, well stirred, it is ready for use. Apply with a clean, half-worn paste brush, it sufficing to merely wet all the wood, and not use too lavishly, or the wood, especially young, will be injured. It must be applied when the trees are quite dormant, and should be kept as much as possible from the hands, preferably protected by rubber gloves. This will destroy the eggs of scale reached, and also eggs and larvæ of thrips and red spider.

**PLAN FOR A MAZE (H. H.).**—In the *Journal of Horticulture*, April 17, 1872, page 323, is given a plan of a maze. As you may not have this number, and it is probably out of print, we may in a future number reproduce the plan.

**VINES FOR LATE VINERY (F. L. D.).**—As you require seven Vines, and will probably require to commence cutting in November onward to April, we advise Madresfield Court, Muscat of Alexandria, Black Alicante, Alnwick Seedling, Mrs. Pearson, Gros Colman, and Lady Downe's; but if you do not want to commence cutting before Christmas, then we advise two Black Alicante, two Alnwick Seedling, one Mrs. Pearson, and two Lady Downe's, which are all of good quality. As the border must be flat provide extra drainage, and do not make a deep border; 24in to 30in is quite deep enough. Crushed bones are the best, using at the rate of a twentieth of the loam, and well incorporating them therewith.

**STEAMED BONE FLOUR (T. R.).**—This is the result of grinding bones that have had the fat and a portion of the ossein melted out of them by being subjected to steam pressure and powerful heat in a close boiler. When the bones are thus dried they can be ground into finer particles than new bones can, and the action of the manure is quicker in consequence, notwithstanding that the finer and drier flour may contain a little less nitrogen. Perhaps your best plan will be to dissolve them by either of the following methods, as may be most convenient:—1, Place 5cwt. (or twelve bushels) of bone on an earthen floor, surrounded by a rim of ashes; pour on as much water as the bones will suck up, and then pour on 2cwt of sulphuric acid; it will boil somewhat violently for a while. When this has subsided, it will get tolerably solid, and the ashes and all may be shovelled up together, and will be fit for use in a day or two. 2, Take a large watertight hogshead and cover the bottom with about 6in deep of dry soil; on this put a layer of bones of the same depth, and cover them entirely with wood ashes; on these another layer of bones, then ashes, and so on till the hogshead is full, placing a good thickness of ashes on the top. Leave it exposed to the rains all summer and winter till spring. Then on removing the contents of the hogshead the bones will crumble to powder under a slight pressure, and form one of the most valuable manures ready for immediate use.

**NAMES OF FRUITS.**—*Correspondents whose queries are unanswered in the present issue are respectfully requested to consult the following number.* (Dr. Appleton).—1, Boston Russet; 2, Reinette Lithuanienne—it is very pretty and very similar to Yorkshire Beauty; 3, Cathlin Pippin—a very good variety that should be more largely cultivated; 4, Mère de Ménage—exceptionally good so far north; 5, Belle de Pontoise—very fine; 6, Flanders Pippin—excellent; 7, Egremont Russet—a splendid sample. All the fruits are large, clean, and would be highly creditable to a southern grower. (H. W., Mon.).—1, Marie Louise d'Uccle; 2, Deux Sœurs. (J. M. W.).—We do not recognise Apple.

### Gardeners' Provident and Charitable Institutions.

**THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.**—*Secretary*, Mr. G. J. Ingram, 175, Victoria Street, S.W.

**UNITED HORTICULTURAL BENEFIT AND PROVIDENT SOCIETY.**—*Secretary*, Mr. W. Collins, 9, Martindale Road, Balham, London, S.W.

**ROYAL GARDENERS' ORPHAN FUND.**—*Secretary*, Mr. Brian Wynne, 8, Danes Inn Strand, London, W.C.

### Publications Received.

"The Canadian Horticulturist." Special features: The Triumph Pear, Summer Treatment of San Jose Scale, Hints to Apple Shippers, Apples in the Georgian Bay District, and A Study in Fruit Blossoms. \* \* "Garten Flora," November 15, 1902. \* \* "L'Horticulture Nouvelle," November 10. Summary: New Cannas for 1903, The new Roses Lyonnaises, Preservation of Legumes during Winter. \* \* "Trees and Shrubs for English Gardens," by E. T. Cook; Country Life Library, 12s. 6d. net. \* \* "Cassell's Dictionary of Practical Gardening," by W. P. Wright, 2 vols., 30s. net. Cassell and Co., Limited. \* \* "The Tropical Agriculturist," November, 1902. Some of the articles are entitled: Coconut Water, Artificial Manuring for Tea, Ceylon Tea in Australia, Foliar Periodicity in Ceylon, African Oil Palm, Fauna of British India, Chinchona Bark and Quinine, Some New Species of Rubber, Fixation of Nitrogen by Algæ, Gardening on Tea Estates, The Indian Rubber Tree, Cultivation of Pineapples, and Pineapples as an Aid to Digestion. \* \* "Cassell's Dictionary of Gardening," Part 19 (7d. net). The part takes us from Terraces to Vitis. Another issue completes the work, which already has been sent to us completed and bound in two volumes. \* \* "Natural Law in Terrestrial Phenomena," by William Digby, C.I.E.; London: W. Hutchinson and Co., Trafalgar Buildings Charing Cross, 1902. \* \* "The New Zealand Farmer, Stock and Station Journal," October, 1902.

### More about Nitragin.

Readers must first be warned against confusing this substance with nitrogen, which, although it is also used, and, in fact, is indispensable as a fertiliser, is of a very different nature. Nitrogen is a chemical substance, whereas Nitragin is a concentrated mass of bacteria; one is an inert mass, the other is pregnant with activity. Professor Hellriegel first discovered that the nodules on the roots of leguminous plants were inhabited by myriads of minute bacteria which had the power of absorbing nitrogen from the atmosphere of the soil; that is, from the small air spaces it contained. That discovery has since been turned to practical use by Professor Nobbe. It had been noticed that on certain fields the nodules on Clover roots were much more numerous than in other fields, and that in the latter the growth of Clover was much less vigorous. The application of a dressing of soil from the former fields upon the latter was found to have a marked effect in increasing the number of nodules and the vigour of the plants. The success of this inoculation led to the systematic culture of the bacteria, and cultures in very concentrated form can now be purchased under the name of Nitragin. This can be applied to the soil in various ways, the most successful one being that termed seed inoculation. The Nitragin is moistened, then mixed with very finely powdered ashes or soil, then again mixed with the seed, which is immediately sown.

On some soils on which Clover does well, Nitragin has absolutely no effect, the bacteria being already present in sufficient numbers; but on sandy or gravelly Clover-sick soils it has a marked effect. In Canada organised experiments with Nitragin have been carried out with encouraging results, and there is certainly a prospect that the substance will take a permanent and important place in the economy of agriculture. It has one drawback, it will not keep more than five or six weeks, and is easily destroyed by being subjected to a heat of 100deg Fahrenheit or above.

If it is difficult to keep in concentrated form, however, there is no reason why it should not be cultivated in a heap of compost, to be afterwards spread on the land when convenient. That would be a practical way of storing it, for it will not bear much light, and in a limy compost heap there would be no danger of an undesirable heat.

It is a matter of common knowledge amongst farmers that nothing improves herbage and encourages the growth of Clovers more than a top dressing of turf from a roadside. The use of limestone, slag, and, to a smaller extent, granite, in repairing roads has encouraged the growth of Clovers on the grass roadsides through the constant spreading of road scrapings on the grassy surface. Of course, we are referring to country roads and primitive methods of road management. When the grass at the side became, by constant additions of scrapings, higher than the surface of the road, a farmer, usually the occupier of the adjacent land, would be requested to plough up the roadside and cart away the soil so moved. This roadside stuff, as before stated, is most valuable as a top dressing to pastures of all descriptions, and we venture to suggest that the source of its action is Nitragin in a natural state, which has been accumulated in the roadside Clover plants.

In the experiments during 1897, 1898, and 1899 at the State experimental farm at Ottawa, one field, part of which had been nitraginised for Clover, was allowed to stand for a second Clover crop, when the difference between the

treated and untreated parts was greater than in the first year, so that there would seem to be some permanence about the results. We have noted that some soils do not require Nitragin, as sufficient bacteria are already present; but there is a very important point besides, and that is, the sufficient aëration of the soil, for if the bacteria have to draw their nitrogen from imprisoned air they will be inactive where there are no air spaces, and it will readily be seen why Clovers and similar plants disappear in water-logged places, for the bacteria cease to exist, and without them the vigour of the plant soon declines.

It requires little argument to show what a close connection this matter has with the desirability, nay necessity, of deep cultivation, and exposure of the soil to the atmosphere, also with the value of green crops for ploughing in, and the waste of fertility when the soil lies long unmoved, and with nothing but weeds growing upon it.

It is supposed by some scientists that other plants besides the leguminous have their parasitic bacteria, which act in a similar, though less marked, way; and, in fact that there may be so few exceptions that the value of soil movement and ventilation may be entirely due to the requirements of these minute servants of vegetable life. But there are other ways of aërating the soil than by cultivation. A great breadth of land is now farmed on the system of temporary pastures, and especially the light soils which have been found unprofitable for corn growing, and some of the heavier lands which are so expensive in horseflesh. When land is allowed to lie in temporary pasture for three, four, or five years, and there is no active cultivation, how is the lower soil to be kept in an open state? The action of worms may keep the surface open, but how about the lower strata? Well, we believe that the value of deep-rooting plants like Burnet, Kidney Vetch, and Chicory lies in their deep penetration into the subsoil, and that their deep root action has a most beneficial effect in keeping open the pores and assisting soil ventilation.

Earthworms no doubt are of great use in the same direction; whilst we have always contended that moles in reasonable quantities must do more good than harm, although so many farmers think differently.

We all know how absolutely necessary an open, free mould is to the Potato crop, and it is quite possible that the Potato may possess minute parasitic assistants also, which, working in the small air spaces, may be breaking up and supplying nitrogen to the tubers.

### Work on the Home Farm.

We have not had a really fine day for a week, and to-day there has been some snow, so perhaps we may soon have some frost. It would do good in many fields, but will be inconvenient if it comes before we get our Swedes taken up. It has been far too wet to get them up lately, and the land is now so soft that we shall not be able to cart on it at present. That will not prevent storing in small heaps, which will be proceeded with when the weather will allow. Hitherto the delay has favoured an increase of the crop. We noticed last week two fields where a start to store Swedes in heaps had been made, and in both cases they were being thrown together just as they were pulled from the ground. This system appears to be gaining ground.

A way sometimes followed to save the labour of pulling is to reverse the two front shares of a horse hoe so that when it proceeds between the two rows of Swedes the shares cut through the Swede roots on either side. This is effective if the shares are kept well sharpened, but it is rather a rough-and-ready way, as a good deal too much is cut off from many of the best roots. It will do for Tankard varieties, which do not root deeply in the ground, but for other kinds we prefer pulling. The week has been bad for threshing, although the smoke of the engine has been noticed here and there. We have been dressing and delivering one lot of corn; the rest of the week has been occupied in tidying up. Through pressure of work the stackyard had been left with too much pulse and heaps of thatch about. The open yards, which were well bedded when the cattle were brought up, were soon converted into morasses by the rain, so all the odds and ends from the stackyard have been carted in and the yards made comfortable once more. The covered yard is dry and comfortable with but little short bedding, and if the weather keeps wet the open yards will be as bad as ever in three or four days. What a difference! But then covered yards cost money. We shall be threshing again directly (money this time, not straw!), and are undecided what to thresh. Barley is very bad to sell just now, and will be until after Christmas, whilst Oats are still a fair trade, though the straw will not be wanted until spring, and will have to be thatched. We think we shall thresh Oats. It is good policy to sell what is most saleable.

Last April we purchased sixpennyworth of water glass, which, after diluting with clean water, we put into a jar capable of containing 200 eggs, which were put in quite fresh as they were laid. The liquid was diluted so as to well cover the eggs. We are using those eggs now, and they are apparently as good as fresh ones.

## Webb & Sons' Stand at the London Cattle Show.

Among the exhibits of roots, cereals, Potatoes, &c., at the Smithfield Club Show; that of Messrs. Webb and Sons, of the Royal Seed Establishment, Wordsley, Stourbridge, is acknowledged to be one of the finest of all. It comprises specimens of the champion roots and grains of the year, which have been grown from this celebrated firm's seed and with the aid of their equally famous special manures. At the recent London Dairy Show a collection of Webbs' Mangolds, Swedes, and Turnips won the first prize open to Great Britain, and Webbs' Imperial Swede also carried off the champion prize, for which there were eighty-two entries. A very fine lot of this Swede is shown, some of the specimens being drawn from the crop, weighing over fifty-eight tons per acre, grown by Mr. R. Roberts, Brongadair, Portmadoc, who has won the first prize, £15 15s., for the best five acres of Swedes, open to England and Wales, this year. Webbs' Imperial Swede has won first prize at Birmingham Show for twenty-five years. Another striking feature of this exhibit is Webbs' New Smithfield Yellow Globe Mangold, a variety which is without a peer for heavy cropping and fine quality. The specimens exhibited were grown by Mr. P. Price, Howick Farm, Chepstow, and the crop, which was grown with Webbs' Special Manure, was certified by a competent and disinterested judge to weigh 93 tons 14 cwt per acre, the record for the year.

Webbs' New Lion Yellow Intermediate Mangold makes another imposing feature, as also do Webbs' Mammoth Long Red and Yellow-Fleshed Tankard, whilst that favourite Yellow Turnip, Webbs' Invincible, is conspicuous for its large size, splendid shape, and quality. Other roots shown include Webbs' New Buffalo Swede, Webbs' Giant King Swede, Webbs' Green Globe Turnip, &c. Webbs' new and improved breeds of cereals are also exhibited, and clearly demonstrate the valuable results that Messrs. Webb have obtained by the course of cross-fertilisation and selection which they have conducted for so many years past at their well-known Kinver Seed Farms. Webbs' Newmarket Oat and Webbs' Kinver Chevalier Barley stand unrivalled for quality and productiveness.

The latter has won the champion prize, open to the world, on seven occasions, as well as most of the other leading honours, including the Colchester Gold Cup, and first, second, and third prizes as recent as last week. Whilst it would be impossible to detail the wonderful list of awards made to the produce of Webbs' seeds this season, we may mention the following recent honours: London, four first and other prizes; Birmingham, fourteen first and other prizes; Cardiff, thirty-seven champion and other prizes; Edinburgh, five first and other prizes; Liverpool, thirty-nine first and other prizes; Norwich, ten first and other prizes; Brewers' Exhibition, London, twenty-seven first and other prizes; four medals and nineteen diplomas; and (with one exception) the whole of Proctor and Ryland's prizes for root crops, value £110 5s. A fine collection of Potatoes introduced by this firm is another interesting feature, and we noticed two new varieties for next season, Webbs' Table King and Webbs' Guardian, which are handsome in appearance and said to be disease-resisters. Messrs. Webb are donors of two challenge cups, value 100 guineas each, at the Birmingham and Edinburgh Shows, and these are also shown on this stand.

### J. King & Sons at the Smithfield Cattle Show.

The system of pedigree selection is now acknowledged to be one of the most remarkable developments in British agriculture. Whether applied to cattle or roots, it is equally important, and the stand, No. 84, of Messrs. John K. King and Sons, seedsmen by Royal Warrant to H.M. the King, of Coggeshall and Reading, furnishes a splendid example of the value of the pedigree selection. It is not generally known that the founder of the business of John K. King and Sons was the originator of the system of saving seeds from pedigree roots, and he and his successors, who have carried it on with so much success, are among the oldest exhibitors at the Smithfield Club Cattle Show. Prominent on this extensive and well-arranged stand are the Essex Prize-winner Yellow Globe Mangold, the Golden Tankard Yellow-fleshed Mangold, and the New Pedigree Swede John Bull; also some splendid specimens of Champion Orange Globe, Improved Yellow Intermediate, and Mammoth Long Red Mangolds.

## Chrysanthemum Analysis.

ONCE more, by the aid of those persons who are deeply interested in the welfare of the Autumn Queen, and who are so wishful to assist the inexperienced, I am able to present an up-to-date selection of Chrysanthemums, fully representing the pick of the Japanese and incurved sections.

Thinking to make the selection still more valuable, I restricted the voters to those who are at present, leading exhibitors, not even adding a selection myself. If this note should catch the eye of any person who has in the past so kindly assisted in this audit and who does not now take an active part in exhibiting, he will readily understand why I did not invite him to take part this season.

This yearly Chrysanthemum audit is eagerly looked for as far away as Australia, New Zealand, and America, where cultivators appear to be equally interested in the flower; they there consider this English selection by votes most helpful to them there in knowing which varieties to introduce for their own culture. A selection of varieties under the method adopted appears to me to better illustrate the opinion of those best calculated to judge as to the selection of a collection, as compared to the making up of a list of those varieties exhibited at any prominent show, like that of the N.C.S. or Edinburgh, because under these newer conditions the opinion of those widely separated is obtained. From the list of the voters given below, it will be seen that no fewer than seventeen counties are represented. From invitations to take part, but three failed to send in selections, no fewer than twenty-seven responding willingly and promptly, which is an indication of the deep interest taken in the selection. One person confined his Japanese varieties to four dozen,

READERS are requested to send notices of Gardening Appointments or Notes of Horticultural Interest, intimations of Meetings, Queries, and all Articles for Publication, officially to "THE EDITOR," at 12, Mitre Court Chambers, Fleet Street, London, E.C., and to no other person and to no other address.

which will account for a slight discrepancy of numbers. It will be difficult indeed for any person to cavil at the selection of varieties in either section.

In the Japanese there is a great absence of varieties in the selected fifty that possess what is known as coarseness; the varieties, when cultivated well, represented all the attributes of a perfect Japanese Chrysanthemum. We have

#### Fifty Best Japanese Varieties

173—total number of varieties.

size, form, colour, and solidity of petal to the fullest extent. So consistent are the varieties raised within the last few years that there is an absence of any great change in the position of varieties in the list. Last year Florence Molyneux, Mrs. Barkley, Le Grand Dragon, M. Louis Remy, and M. Chenon de Leché tied for the premier position. This time, M. Louis Remy still occupies a similar place, while the others have receded but a vote or two, which illustrates their consistency in all respects, especially in constitution for growth. This is a point that has always to be contended with in Chrysanthemum culture. Plants that are grown at express speed, as it were, are liable to have their constitution impaired; none but the strongest can withstand the feeding the plants are subjected to.

As was to be expected, that magnificent coloured variety, W. R. Church, has advanced its position, and now stands at the head of the poll along with two others. Mrs. G. Mileham, another charming variety, both in form and colour, is at the head, and rightly so, as it would be difficult to name a better type of a Japanese Chrysanthemum. This variety so naturally reflexes its florets under decent cultivation as to dispense altogether with the necessity to "turn" its petals, a process objected to by some persons.

Australie still holds its place as the finest of the incurving Japanese kinds; no other variety is so typical of this section, and those who attempt to improve its appearance by "turning" its florets have much to learn in the management of this variety. Madame Carnot still maintains its position as one of the best of white flowering varieties, and so does Mrs. Mease as a pale yellow form. Its sport, G. J. Warren, has dropped lower down; its place is now occupied by Mrs. Greenfield, which is perhaps the finest yellow-flowered variety in cultivation, along with Bessie Godfrey, both yellows, but of an entirely different tint of colour. Both possess, too, form of the best kind, not a particle of what can by any stretch of imagination be termed coarse.

Madame Paolo Radaelli, from four votes last year, has this time risen to twenty-three. At times it is an exceedingly fine incurving variety; at others its florets droop gracefully with but a small curl in them. Duchess of Sutherland from two votes has risen this year to twenty-two, which proves that its intense yellow colour and peculiar florets have admirers.

Two practically new varieties—Mrs. T. W. Pockett and Mr. F. S. Vallis—now occupy a very prominent position. The last named is one of M. Calvat's best, and was not once mentioned last year. This time it receives nineteen votes, while the former has risen twenty-one votes. Both of these are yellow-flowered, but quite distinct in tint from any other. Mafeking Hero, not once mentioned last year, this time receives twenty-one votes. I look upon this as quite one of the best of bright coloured varieties. The manner in which Edwin Molyneux still retains a strong position is little short of marvellous, considering it was introduced as far back as 1886. Now it is quite alone in its colouring. Of the thousands of seedlings raised from it not one has the colour of itself. In constitution, too, it does not lack.

Edith Tabor, at one time regarded as one of the best of yellow-flowered varieties, has dropped quite out of the selected fifty. It cannot be said that this variety retains its former size, although it does in colour and form. Such huge coarse-growing varieties as Mrs. White Popham, Mrs. G. W. Palmer, Graphic, International, and Mrs. C. H. Payne have almost dropped out of existence, and fortunately so will be the general opinion.

Mutual Friend, which at one time was regarded as one of the best of white-flowered varieties, has now given place to others of the same colour but of superior "build." Last year it was in the selected fifty; this time but two persons name it. That charming section of small flowered forms of Vivian Morel are found wanting in size; even the type itself does not now receive support, showing clearly that size is still an element of consideration. Miss Elsie Fulton, from four votes last year, has risen to twenty-one, as it was sure to, having all the characteristics of a thorough incurving flower of the purest white. Lord Ludlow still maintains its position, and rightly so.

Many others beside myself will be surprised at the position occupied by Pride of Madford, itself quite alone in colour, and a gorgeous colour too. At the present time it is not even in the selected fifty. As was to be expected,

the total number of varieties exceed those of last year, but not in a great degree. Last year sixteen persons named 152, while the twenty-seven this time give 173 names—not a great increase really. This is a step in the right direction, as I think voters are more in accord of what should be the prevailing points of excellence.

#### Thirty-six Best Incurved Varieties.

|                           |                                |
|---------------------------|--------------------------------|
| 19 C. H. Curtis           | 4 Cecil Cutts                  |
| 19 Duchess of Fife        | 4 King of Yellows              |
| 19 Hanwell Glory          | 4 Mrs. W. Howe                 |
| 19 Miss Nellie Southam    | 4 Perle Dauphinoise            |
| 18 Lady Isabel            | 4 Mrs. J. Murray               |
| 18 Frank Hammond          | 4 Violet Tomlin                |
| 18 Ialene                 | 4 Creole                       |
| 17 Madame Ferlat          | 3 Charles Blick                |
| 17 Mrs. R. C. Kingston    | 3 Mrs. Molyneux                |
| 17 Topaze Orientale       | 3 Mrs. J. Eadie                |
| 17 Ma Perfection          | 3 The King                     |
| 17 Mrs. H. J. Jones       | 3 Madame Durandel              |
| 17 Pearl Palae            | 3 Comtesse d'Etoile            |
| 15 Chrysanthemiste Bruant | 3 Mrs. S. Coleman              |
| 14 Globe d'Or             | 3 Miss E. Gerrard              |
| 14 R. Petfield            | 3 Baron Hirsch                 |
| 13 Countess of Warwick    | 3 Mrs. Gerard Williams         |
| 12 Fred Palmer            | 2 Egyptian                     |
| 12 Lord Alcester          | 2 Miss F. Southam              |
| 12 J. Agate               | 2 May Bell                     |
| 12 Ralph Hatton           | 2 Mrs. W. Higgs                |
| 11 Mrs. C. Crooks         | 2 W. Neville                   |
| 11 Empress of India       | 2 Annie C. Love                |
| 10 Mrs. F. Judson         | 2 President Bevan              |
| 10 W. Higgs               | 2 Mr. F. King                  |
| 10 Louisa Giles           | 2 Alfred Salter                |
| 10 Golden Empress         | 2 Austin Cannell               |
| 10 John Lambert           | 2 Bonita                       |
| 9 Major Bonaffon          | 2 Ada Owen                     |
| 9 Mdle. Lucie Faure       | 1 Henry Ellis                  |
| 9 Madame de Verneuil      | 1 The Colonel                  |
| 9 Miss V. Foster          | 1 Edinburgh                    |
| 9 Miss Annie Hills        | 1 John Doughty                 |
| 9 Ernest Cannell          | 1 Prince Alfred                |
| 9 Miss D. Foster          | 1 C. R. Whitnall               |
| 8 George Haigh            | 1 Yvonne Desblanc              |
| 36                        | 1 John Carvill                 |
|                           | 1 Mrs. W. Harvey               |
|                           | 1 Mrs. E. Bennett              |
|                           | 1 Snowdrift                    |
| 7 General Symonds         | 1 Mrs. J. Seward               |
| 7 Nellie Threlfall        | 1 Madame Desblanc              |
| 7 Matthew Russell         | 1 Lord Coleridge               |
| 7 George Lock             | 1 Miss R. Hunt                 |
| 7 Dome d'Or               | 1 Madame E. Rogers             |
| 6 Bonnie Dundee           | 1 Colonel Kekewich             |
| 6 Nellie Stevens          | 1 Eldorado                     |
| 6 Miss E. Seward          | 1 Fouka                        |
| 6 Miss M. A. Haggas       | 1 Madame Darier                |
| 5 Miss Doris Cox          | 1 D. B. Crane                  |
| 5 Edith Hughes            | 1 Thomas Singleton             |
| 5 Mrs. W. C. Egan         | 1 Major Matthew                |
| 5 Pantia Ralli            | 1 Watteau                      |
| 5 Queen of England        | 1 Lydia                        |
| 5 Golden Madame Ferlat    | 1 Mrs. C. J. Mee               |
| 5 Thomas Lockie           |                                |
| 5 Princess of Wales       | 108—total number of varieties. |

#### List of Voters.

Mr. A. Simmons, The Grange, Framfield, Sussex  
 Mr. C. Penford, Leigh Park, Havant  
 Mr. Folkhard, Sand Hutton Hall, York  
 Mr. R. Kenyon, Monkham, Woodford, Essex  
 Mr. J. H. Goodacre, Elvaston Castle, Derby  
 Mr. Neville, Cornstiles, Twyford, Winchester  
 Mr. Nobbs, Osborne House, Isle of Wight  
 Mr. T. Lunt, Keir, Dunblane, N.B.  
 Mr. D. Niccoll, Rossie, Forgandenny  
 Mr. W. Mease, Downside, Leatherhead  
 Mr. C. J. Salter, Woodhatch Lodge, Reigate  
 Mr. G. Hall, Melchet Court, Romsey  
 Mr. G. Haigh, Highfield, Woolton, Liverpool  
 Mr. W. Hunt, Ashstead Park, Epsom  
 Mr. W. Higgs, Fetcham Park, Leatherhead  
 Mr. C. Crooks, Hedsor, Droitwich  
 Mr. G. W. Drake, Cathays Terrace, Cardiff  
 Mr. J. Heaton, The Lawn, Aigburth, Liverpool  
 Mr. C. Beckett, Chilton Lodge, Hungerford, Berks  
 Mr. W. Meredith, Stanstead Park, Emsworth  
 Mr. Jefferies, Moor Hall, Harlow, Essex  
 Mr. Perkins, Greenlands, Henley-on-Thames  
 Mr. G. Foster, Glendanagh, Teignmouth  
 Mr. W. L. Bastin, Buscot Park, Berks  
 Mr. J. Bible, Draycot Park, Chippenham  
 Mr. J. Brooks, Brandon Hall, Coventry  
 Mr. C. Payne, Sandrills, Bletchworth, Surrey

#### Notes on the Incurved Section.

As was to be expected, all the voters are not cultivators of the Incurved section; they, therefore—rightly, too—did not send in a selection. Nineteen persons took part this time, and without any hesitation I consider the selection given as typical of deserving varieties of the present-day requirement of size and colour. In too many instances—away from the leading cultivators—a want of form has been all too apparent this season. Cultivators are not wholly to blame in this; it is not possible to obtain the true incurved form in some varieties that are admitted into this section. A greater prohibition of varieties that are bred from Japanese kinds would raise the standard of this section.

With C. H. Curtis and Duchess of Fife, Hanwell Glory and Miss Nellie Southam share the honour of being first. The two former occupied a similar position last year. Neither of the two show any sign of failure or a want of popularity at the exhibitions, possessing, as they do, all the attributes of good blooms. The last-named has considerably improved her position in the list since last year; it is a variety worthy of encouragement, being of a taking colour, full size, and desirable form. Frank Hammond, as I predicted last year, has made good strides; it is a flower of exceptional merit. The six varieties that share the third place are all of the right order, if I except one—Topaze Orientale. True, its colour is pleasing, but except when in the best hands it lacks the fulness of petal of such sorts as Mrs. H. J. Jones or Mrs. R. C. Kingston. Chrysanthemiste Bruant, with fifteen votes, is not so highly valued as last year, and rightly so, in my estimation, as it lacks the globular form so desirable.

Fred Palmer, from a solitary vote last year, has risen to twelve marks this time; it possesses all the desirable points of an incurved variety. Lord Alcester, Empress of India, and Golden Empress receive a fair amount of support considering that they are distinctly on the down grade, as the trio, in fact all the members of the family, lack constitution sufficient to enable them to build up good blooms. Mrs. C. Crooks and Mrs. F. Judson occupy a strong position. The last-named last year was not mentioned, while the former received but one vote. That one-time favourite, Princess of Wales, still finds the same number of adherents—five—as last year. It is safe to say that this and its offspring Violet Tomlin, Miss M. A. Haggas, and Mrs. S. Coleman, will in a very short space of time only be heard of occasionally. Many old-time favourites receive but scant support, notably Prince Alfred, which in the neighbourhood of Liverpool twenty years since was the most popular of all. In the present list Jeanne d'Arc, Mons. R. Bahuant, Mrs. Dixon, George Glenny, and Mrs. G. Rundle do not find mention. Fortunately, varieties of doubtful origin, like General Symonds, Perle Dauphinoise, The Egyptian, President Bevan, and Mdle. Laurence Zede receive scanty support, the last-named not being mentioned once in a long list. Without exception these varieties are more injurious to this section than otherwise; one or two such blooms in a stand go a long way towards lowering the standard of quality.

At one time Princess Teck, and its progeny were numerous in any exhibit, and so was Novelty and Lady Hardinge; not one is now mentioned. The present list contains 108 varieties, which is but ten more than last year, from twelve electors.

Judging from the present analysis the incurved section is a long way from being an extinct section, containing as it does ample material for display; but whether the present general method of staging is to be continued is a moot point which time alone can determine.

EDWIN MOLYNEUX, V.M.H.

#### Flowers from the Riviera.

It is reported that arrangements have just been completed by which it will be possible to send fresh-cut flowers from the Riviera to England cheaply and rapidly. A number of florists have arranged to send small boxes of flowers in hampers to an agent at Calais by the express flower train, which leaves Mentone soon after 10 a.m., reaching Paris in thirteen hours. At Calais the hampers are put on board ship, stamped with English stamps, and posted at Dover by parcel post. The flowers should reach their destination in forty-eight hours, and the cost of small boxes under 1lb in weight should not exceed 6d. or 7d.

## Forcing Asparagus.

In order to have suitable roots for forcing, it is important that they should be at least four years old, and have had previous good and generous cultivation, so that the roots are large and strong, and possess power to produce stout and succulent growths. Forcing Asparagus is not difficult, providing the proper roots are available and a hotbed can be formed. A very high temperature is not required—indeed, a strong heat, which is also dry, is injurious, and productive of weak, flavourless growths.

Roots for forcing may be bought, but it is an expensive method of obtaining them. It is much better to grow Asparagus on a system whereby a certain number of roots are available each year, because after forcing they are practically useless for anything further. Home-produced roots should, therefore, be established every season, so that there shall always be the number required without encroaching on the permanent beds. This will permit, therefore, of having four-year-old roots when the system is once established. The best time to plant Asparagus is in spring.

Asparagus being now at rest, the roots may be lifted when the ground is not frozen. Place them in a sheltered position, and cover with soil until ready to place on a hotbed. The best kind of hotbed for forcing is one built up of stable manure and leaves, on which place a frame with lights. The materials for the hotbed should be thrown together in a heap, judging about the quantity required, which must be ample to build a bed 5ft high at the back and 3ft in front, the size of the bed being at least 12in wider than the frame all round, but better a little more. The reason for this is that linings of warm manure can from time to time be placed round the frame to maintain the temperature. When the manure and leaves begin to heat well turn them over, doing this several times, or until the rank and excessive heat engendered has passed away.

Build the bed in a sheltered part of the garden, as penetrating winds from any quarter will quickly cause the loss of heat, which must be retained as long as possible. When the bed is finished place on the frame and lights. Thrust a stick into the heap, and withdraw in a few days, and feel how the heat is going on. The temperature the bed should reach ought to be 70deg. Then cover the surface with soil an inch thick, and on this layer place the clumps of Asparagus roots as thickly as possible. Scatter soil between, but do not cover up the crowns.

Give a slight watering with a rosed can, using warm water. The lights may be covered over with mats until growth begins. This will assist in maintaining the temperature. As the heads begin to appear, apply no covering to the glass except at night, to conserve heat and ward off frost. The full light will cause the heads to become green, which is necessary. Afford air also on favourable opportunities.

During the process of forcing a supply of leaves and manure should be kept in readiness to apply as linings round the frame, so as to maintain the heat regular and uniform. A healthy humidity may be kept up in the frames by an occasional sprinkling with tepid water.—E. DENNIS.

## THE CHERRY HOUSE.

To have ripe Cherries in April the trees must now be started. Early Rivers, Governor Wood, and Black Tartarian are unsurpassed for size and quality, it being unwise to grow many varieties, as these will give a long succession of fruit. In the case of trees in pots, greater variety may be indulged in, yet there are few to equal those named. Be careful of fire heat at the commencement, not employing it unless absolutely necessary to maintain the temperature at 40deg during the night and 45deg to 50deg by day, ventilating when the temperature is that, and not allowing 55deg to be exceeded without full ventilation. Close the house at 50deg. Syringe the trees and other surfaces early on fine afternoons, so as to admit of the buds becoming dry before night. The border will be sufficiently moistened through the removal of the roof lights; if not, it must have water to bring it into a thoroughly moist state. Trees in pots, if at all dry, will require repeated supplies of water to secure the thorough moistening of the soil to the base of the pots.

Aphides do not usually appear until the buds swell and growth takes place, but a sharp look-out should be kept on the buds, and if there are any minute dark objects about them it is wise to fumigate on two or three consecutive evenings. This will make quick work of the small aphides that may appear from the eggs as result of the warmth, and repeating the fumigation at intervals of a fortnight or three weeks it is likely there will be few or not any to infest the growths. Of course, the aphides may come on the wing, but that takes time to arrive at, the eggs, as a rule, being deposited on the Cherry trees in the autumn. The thing is to keep the trees clear of the pests, otherwise Cherries will not be forthcoming fit for use.—G. A.

*Cypripedium niveum.*

Mr. W. Watson, in his book, "Orchids, their Culture and Management," says of this species: "This is a gem amongst Cypripediums. The leaves are small, dark green on the upper side, irregularly blotched with grey, the under side being of a dull vinous red; the flowers are on erect scapes, from 3in to 6in high, solitary, or rarely produced in pairs, and pure, soft, snowy white, save for a few freckles of cinnamon irregularly scattered over the sepals and petals. The appearance of the plant, when not in flower, is very similar to that of *C. concolor*, the flowers of which are yellow. It blossoms during spring and summer, and remains in perfection about a month. It requires tropical treatment, and some broken limestone should be added to the peat and sphagnum used in potting. It is sometimes stated to be a native of Moulmein, but this is an error; the plant is a native of the Straits of Malacca, and is brought to Moulmein by the coasting steamers in exchange for Moulmein Orchids; it has also been received from the west coast of Siam. Figured in the "Botanical Magazine," t. 5,922."

## The Week's Cultural Notes.

There is nothing to be gained by keeping the deciduous *Calanthes* about in their old pots after flowering, and, for the sake of tidiness, they may at once be repotted, this saving time at a more busy season. There are still some growers who adopt various devices, such as boxes of sphagnum across small pots, and other things to start the bulbs growing, but they are entirely unnecessary, and plants potted now into the flowering size will be just as likely to start regularly and well as others potted and repotted again. Besides this, there is no chance of damaging the young roots, of which there is great risk in repotting.

As to the compost for *Calanthes*, I have never been a believer in a quantity of manure. Just a little well-dried old cow manure may be added to the peat and loam perhaps with advantage, but it is better left out entirely than used to excess. Growers often point to the immense bulbs made when the roots are heavily fed with manures, chemical and other, but I have never found that the very large pseudo-bulbs produced made a better flower than medium-sized well-grown ones.

In repotting keep the base of the pseudo-bulbs just beneath the surface of the compost; if a few of the old roots are allowed to remain it serves to hold the bulbs in position, but, if necessary, small stakes should also be used, for nothing is worse than a plant wobbling about at the root. Three fair-sized pseudo-bulbs are enough for a 6in pot, using a greater or smaller number as the pots are larger or smaller. Good fibry loam, three parts, and peat, one part, with plenty of finely broken crocks and chopped sphagnum, will be a good compost, while about half the depth of the pot should be taken up with drainage, the crocks being covered with rough moss.

After potting, the plants may go to a light, sunny shelf in a warm house, and will require no water until they commence to grow. When the weather is fine and the house fairly dry, a light dewing overhead with tepid water from the syringe can do no harm, but as the growths begin to push, even this must be gone about with caution, bright bursts of sunshine in early spring having the effect of damaging the tender foliage, rendering the plants unsightly all the summer.—H. R. R.

## The Pear Famine.

It is said that Pears were never so scarce as they are at the present time, and not for many years have such high prices ruled in the markets for these fruits. There are very few English Pears on sale, and those that are on offer are small and very indifferent. Some very fine Easter Beurrés are coming in from Paris. They are put up in pads holding forty and forty-eight Pears each. Wholesale they are selling at 7s. and 8s. a package. Then there are the fine Glou Morceau, from the same centre; packages of thirty-six and forty-eight fruits are being sold from 8s. 6d. to 10s. each first hand. Choicest samples have made as much as 12s. 6d. At 2s. 6d. and 3s. a dozen they yield excellent profits to the French shippers. It is clear that the public cannot expect to buy Pears this Christmastide except at high and really famine prices. Certain Jersey Pears are fetching 8d. apiece, or 4s. for six, in London.

## Gadding and Gathering.

"HERE AWA', THERE AWA'."

### Three Dessert Apples.

The three varieties are Ross Nonpareil, Mannington's Pearmain, and the sweet little Wyken Pippin. The first and last named are small Apples, the other is of medium size; it is also the more beautiful, having a crimson skin on the sunny side. Ross Nonpareil has a flavour akin to Cox's Orange Pippin; Mannington's Pearmain has also a spiey, delicious flavour; and Wyken Pippin (also named Warwickshire Pippin) is distinctly aromatic, juicy, and pleasantly sweet. In point of flavour these Apples appear to leave nothing to be desired, and this is surely the strongest feature of merit in any dessert Apple. Mannington's Pearmain and Ross Nonpareil are both easy to digest, though the Wyken appears less easy to dissolve. In Messrs. James Veitch & Sons' new fruit catalogue, just published, I find the following reference to the three Apples named:—

**ROSS NONPAREIL.**—Excellent, medium size, richly flavoured, and highly perfumed; a very pretty Apple, covered with russet, and having a crimson tinge on the side facing the sun; this variety, which forms a medium-sized pyramid, will succeed in almost any soil; suitable for orchard culture. November to May.

**MANNINGTON'S PEARMAN.**—Excellent, medium size, juicy and sweet; the flavour is rich, but in order to have it in perfection the fruit should be allowed to hang late on the tree, it being one of the best late varieties; though the tree as a pyramid bears abundantly, it only attains a medium size. November to March.

[It requires a well drained soil.]

**WYKEN PIPPIN.**—Small and handsome, juicy, crisp, and rich flavoured; the tree forms a dwarf pyramid, and bears well; suitable for orchard or garden culture. December to April.

### Floral Decorations.

Now that the Cyclamens are in flower, pot plants can be put to use. In Regent Street, London, a few days ago, I saw an oblong basket, 15in. by 9in., and 4in. to 5in. deep, raised on a pedestal, and having simply a thickly flowered pot Cyclamen in the centre, a tiny Cocos Weddelliana a little to one side, in front, and a bosky setting of Asparagus Sprengeri at the back. Behind all, broad silk ribbons, of a colour that matched the flowers, depended.

A huge circular wreath was composed of Heather, closely pegged down upon the framework, and having an outer and inner fringe of the silver-edged Euonymus leaves, each laid evenly over the other. A large, loosely expanding bouquet of light pink Chrysanthemums, matching the Heather, was fastened at the top (the wreath suspended). From the back of this bouquet hung two broad ribbons, thus screening the vacuum within the circle. Another magnificent wreath was composed of rose-pink Chrysanthemums, with a spray bouquet of pink Erica at the top, and a tiny bouquet of the same, fixed three parts down on the right-hand side. No ribbons or "fringe" was used.

Yet another wreath, and this was furnished with Erica, close laid, and a huge spray of Lily of the Valley, with A. Sprengeri at the top, from which two very broad white silk ribbons were fixed. The ribbons hung obliquely, one to either side, making the shape of an inverted V. Other flowers in use now are Lorraine Begonias, Persian Ranunculi, Roses, Lilium speciosum, Lilac, Carnations, and Gardenias.

In a tall cross—the cross-piece fixed obliquely—were used white Chrysanthemums, set in evenly on the column and cross-piece, and a narrow crescent of Violets slung over the point of intersection of

cross and column. The plinth and base were formed of white Chrysanthemums, with a huge spray-bouquet of Lily of the Valley and Violets entwining the base of the column.

### "Special Lines" at Exmouth.

Mr. W. J. Godfrey, of Exmouth, Devon, grows many other subjects besides Chrysanthemums, including such diversified garden stock as Vines in one direction, with Japanese Rhododendrons and Kalanchoe flammea in another. Hardy fruit trees he also cultivates considerably in a special branch nursery, whilst the best known ornamental shrubs also find a place. The Vines, be it noted, are principally grown to supply Grapes for his handsome seed, bulb, and florist shop in Rolle Street, Exmouth.

Winter-flowering Carnations were seen in considerable numbers at his main nursery in November. Queen of Pinks was throwing abundance of bloom. It is deeper in colour than Duchess of Fife. Godfrey's King is an intense deep crimson, a very free flowerer, and good grower. Mrs. Thos. W. Lawson has quite recovered from the effects of over-propagation in its early career, and at Exmouth, as elsewhere, its brilliant colour and finely fringed large flowers were amongst the best in the collection. Beauty of Exmouth is another fine variety. Roses, too, are represented by the latest novelties, Liberty seeming to do especially well. Zonal Pelargoniums furnish a feature here, and such reputed sorts as Duchess of Cornwall, of a pale salmon and flesh colour, was represented in large batches. The trusses are large; the colour is exceedingly pleasing; it is floriferous, and the habit is dwarf and sturdy. Alice of Venensis, with its white centre and scarlet edge, was also very brilliant.

The Show and Fancy Pelargoniums find more than the usual recognition, a fact which affords one satisfaction to chronicle. Is it because these plants require a trifle more attention than some other plants do to grow them well, that they are not more liberally taken in hand? Novelties amongst Heliotropes were noted. The newer Heliotropes have larger flower heads, and afford a variety of colour, from white to purple, and they are dwarf and fragrant. Amongst other plants that enjoy special prominence are Callas. These brief

notes refer to Mr. Godfrey's main lines in nursery stock, and it must suffice to say that he manages them as successfully as he does Chrysanthemums. — WANDERING WILLIE.

*Cypripedium niveum.*

## Flowers and Vegetables

London, happily, is in no likelihood of suffering from a vegetable famine this Christmas such as is just now causing dismay in Paris, though the increased prices obtained at Covent Garden for many vegetables and fruits showed the effects of the recent severe weather. A few special forced things were indeed costly. In the vegetable market good Potatoes are very scarce, and 1s. 6d. to 2s. a cwt. dearer than usual. Ordinary French Asparagus is now 7s. 6d. a bundle, but the epicurian Asparagus of Argenteuil cannot be got there under 35s. a bundle, and is sold in London at 42s. and 45s. a bundle. Haricots Verts have gone up 4d., and are now 1s. 6d. a pound. English Beans are 2s. a pound. French salads have been practically off the market altogether, because they have reached London frozen, and consequently useless.

English Apples are very scarce, and Cox's Orange Pippins, the favourite dessert Apple, are 4s. a dozen. On the other hand, Grapes are

cheap, and Nuts are much cheaper than at last Christmas. Cob Nuts are 6d. instead of 10d., Brazils 7d. against 9d., and Almonds 6d. instead of 7½d. Oranges also are cheap. Flowers, too, were very dear. The funeral of Colonel McCalmont had caused an enormous demand, and prices, which had already been made high by the weather, reached a point quite 50-per cent. above the normal average.

### N.R.S. Annual General Meeting.

The twenty-sixth annual general meeting of the National Rose Society was held in a room of the Hotel Windsor, in Westminster, on the afternoon of Thursday, December 11. The weather being agreeably cold and healthful, a goodly number of members signed the book, the full attendance being as follows: Charles E. Shea, Esq. (in the chair), with Messrs. Joseph H. Pemberton, E. B. Lindsell, John Strange, H. Shackleton, G. W. Cook, John Ballmore, Thos. B. Gabriel, C. Holbrook, Conway Jones, G. Gordon, Maxwell T. Masters, Geo. Paul, Chas. Hayward, Ed. Mawley, H. S. Bartlett, A. Savage, C. Cape, W. Gaseling, R. Harkness, K. H. Gifford, Ed. J. Holland, A. Turner, H. E. Molyneux, E. T. Cook, G. Moules, T. N. Flintoff, H. J. Spooner, J. R. Mattock, R. Foley-Hobbs, F. Page-Roberts, Clifford Chadwick, H. P. Landon, Richard E. West, L. G. Pawle, F. Cant, F. Wellesley, R. Powley, G. W. Piper, F. Dennison, and A. C. F. E. Prince.

The preliminary business having been disposed of, Mr. Frank Cant and C. B. Gabriel were appointed scrutineers of the ballot for the annual election of officers. (The names of officers that appeared on the balloting list, sent out to each member prior to the meeting, was adopted, with the addition of the Lord Provost of Glasgow and ex-Provost Mitchell to the list of vice-presidents.)

The report of the committee and financial statement for 1902 was then presented, the latter being read first, owing to Mr. C. Hayward, the treasurer, having to leave the meeting early. The report is given hereunder:—

#### Report of the Committee for the Year 1902.

In presenting their report, the committee congratulate the members upon the increasing influence and prosperity of the society. The only drawback during the year was the much smaller sum received in gate-money at the exhibition in the Temple Gardens as compared with the previous year. This, however, is a drawback to which all horticultural societies holding independent shows are at times liable, and which is only seriously felt when there is no substantial guarantee or reserve fund to fall back upon. The committee are of opinion that the smaller attendance of visitors at the society's Temple Show is only to be accounted for by the general depression which at that time prevailed throughout the country owing to the serious illness of the King. All public functions of a similar character held during the early part of July appear to have suffered in the same way.

The flowering season proved this year so exceptionally backward that, even as late as Midsummer Day, fears were entertained that there would be but few Roses available for the Temple Rose Show. Fortunately, warmer weather set in soon afterwards, with the result that that exhibition, although by no means a large one, proved the most varied in arrangement and enjoyable that the society has yet held. Taking the number of exhibition Roses as a guide, it was the smallest metropolitan show since 1893—or for nine years.

The committee thankfully acknowledge their great indebtedness to the Treasurer and Benchers of the Inner Temple for again granting the society permission to hold the exhibition in their gardens. Their thanks are likewise due to the President and Council of the Royal Horticultural Society for so generously placing the Society's staff of assistants, including Mr. S. T. Wright, the superintendent of the Chiswick Gardens, at their disposal on the show day. To those members who rendered such substantial help this year by their promised contributions to the Temple Show Guarantee Fund, amounting in all to £360, the committee feel that their thanks are specially due.

The southern show, which took place at Exeter two days after the metropolitan exhibition, was, owing to the lateness of the season, also an exceptionally small one. On the other hand, the show at Manchester proved unusually extensive; indeed, with only four exceptions, it was the largest exhibition that has yet been held by the society in the provinces. Taking together the average quality of the exhibits and the number of them, it must be regarded as having been the finest Rose show of the year. The arrangements made in connection with both exhibitions reflect great credit respectively on Mr. G. D. Cann, the secretary of the Devon and Exeter Horticultural Society, and on Mr. P. Weathers, the curator of the Royal Botanic Gardens at Manchester. The success of these exhibitions was also in a great measure owing to the kind exertions of two of the society's vice-presidents—Mr. Peter Veitch, who

acted as the society's representative at Exeter, and Mr. James Brown, who, with equal energy and tact, furthered the society's interests at Manchester.

During the course of the year a new edition of the "Hints on Planting Roses," brought up to date, and also an entirely new edition of the "Official Catalogue of Exhibition and Garden Roses," compiled by a special committee appointed for the purpose, have been published and issued to the members. The necessity for reprinting the above and other publications of the society so soon has arisen through the exceptionally large increase of members during the last two years, which could not have been foreseen when the last editions of those publications were printed.

The committee regret to announce the loss through death of Mr. Charles J. Grahame, one of the society's vice-presidents. Mr. Grahame had for many years taken the keenest interest in the welfare of the society, and was at all times its most generous supporter. He will, no doubt, be best remembered for his energetic action in bringing about the adoption of the regulation that requires amateur exhibitors to show according to the number of plants they grow, a regulation which has worked well, and has now been in force during the last ten years.

It is with the deepest regret that the committee record the resignation, in February last, through failing health, of the Rev. H. Honeywood D'Ombrian, the founder of the society, and for twenty-five years its senior secretary. Throughout the whole of that period his labours have been untiring, and the committee cannot but feel that the present satisfactory position of the society is in a great measure due to the ability, energy, and tact unremittingly displayed by him on its behalf. At the committee meetings of the past year, as well as at the Temple Rose Show, his genial presence has been greatly missed. Mention should also be made of that semi-official publication of the society, "The Rosarian's Year Book," of which Mr. D'Ombrian was the editor during the whole period of his secretaryship—the issue of which has now, unfortunately, ceased.

As Mr. Wollaston will in future be residing away from London during the winter months, he has reluctantly tendered his resignation as one of the hon. auditors of the society. In accepting this resignation, the committee take the opportunity of thanking Mr. Wollaston for his kind services as auditor during the past seventeen years.

#### FINANCE.

Although the receipts at the last Temple Rose Show fell short of the amount taken at the previous exhibition by £150, it has only been necessary to draw upon the guarantee fund to the extent of £90. That a larger sum was not required has been almost entirely owing to the large amount received this year in new subscriptions. The net gain, as in the preceding year, has been 150 members, thus bringing up the aggregate number of members to 890. The total receipts amounted to £1,248 4s. 3d., and the expenditure to £1,233 5s., leaving a balance of £14 19s. 3d. to carry forward to 1903.

#### ARRANGEMENTS FOR 1903.

The metropolitan exhibition will again be held, by the kind permission of the Treasurer and Benchers of the Inner Temple, in the Temple Gardens, on Wednesday, July 1. There will be no southern exhibition next year, but arrangements have been made to hold the northern show in St. Andrew's Hall, Glasgow, on July 15, in conjunction with the West of Scotland Rosarians' Society. The only previous occasion when the society has visited Scotland was in 1887, when a most successful exhibition was held in the Waverley Market, in Edinburgh.

#### MEMBERS' PRIVILEGES.

Members subscribing one guinea will be entitled to six 5s. tickets, and subscribers of half-a-guinea to three 5s. tickets of admission to the society's exhibition in the Temple Gardens; or, if preferred, any of these tickets may be used instead for the society's northern show in Glasgow. Members joining the society for the first time in 1903 will also receive copies of the following publications: The recently issued edition of the "Official Catalogue of Exhibition and Garden Roses," the new and revised edition of the "Hints on Planting Roses," the "Report of the Conferences on Pruning and Exhibiting Roses," the "Report on the Constitution of Rose Soils," the "Conference Report on the Decorative Use of Some Garden Roses," and to a symposium on "How to Grow and Show Tea Roses." Members alone are allowed to compete at the shows of the society. Members will be entitled to purchase tickets for their friends for the Temple Rose Show at reduced prices.

In conclusion, the committee desire to convey their best thanks to the donors of the numerous special prizes which were this year presented to the society, and especially to Captain Ramsay for the handsome prize he again offered at the Temple Rose Show, in what has now become one of the most popular classes in the exhibition. The local secretaries have again done good service, and more particularly Mr. H. S. Bartlett and Mr. H. E. Molyneux. To Miss Willmott the thanks of the committee are

especially due, for in no other year since it has been established has any member succeeded in obtaining for the society such a large number of new and influential subscribers.

The chairman moved the adoption of the report, and said that it was rather an optimistic document, but this was excusable for a society determined to succeed as this was. They must not let little clouds on the horizon repel their endeavours. There was, indeed, very satisfactory progress, for 150 new members had been enrolled. They should keep this in mind, whatever may have been the loss in gate-money at the show. They had now a larger membership than ever before in the history of the National Rose Society. They must not adopt the idea that they had got beyond the experimental stage of the Temple Show. They saw a drop in the receipts of £150, and the committee points out to certain causes affecting this. For instance, the Holland House Show coming before their's, many people thought they had enacted their obligations to the Queen of Flowers when they had visited it. Mr. Shea, continuing, thought that a reserve fund would be better than a guarantee fund, but there was a greater fund—The Public—and the society must cater for the public taste. He had heard among his friends, as, doubtless, so had his listeners, that they (his friends) don't care to see serried ranks of flowers. The number of non-competitive growers of the Rose, compared with those who exhibited, were as 100 to 1. He should like to see bolder and finer effects, similar to those at continental exhibitions; and if this was advisable, no doubt the Trade could bring in tall pillar Roses, and garlands of them, and furnish these bolder groups.

With regard to an autumn show of Roses, the propositions he likened to seed sown, which had only to be watered. The society had presented its members with a new catalogue—one much wanted, and very admirable. Touching on the death of Mr. G. J. Grahame, Mr. Shea said there was also a sad side to everything joyous in this life. Mr. Grahame had always been the champion of the weaker men, of the small exhibitor against the large. Mr. D'Ombraïn, too, whom he might call the Nestor of Roseland, was now unable to be with them, and he knew it would be in accordance with the desire of everyone present that a sympathetic message be conveyed to Mr. D'Ombraïn, wishing him a continuance of fair health and happy days. The motion was seconded by Mr. Geo. Paul, who supported the idea of establishing a reserve fund, but thought that for another year at least the guarantee fund should be maintained.

The Rev. Jos. H. Pemberton spoke to the report. He referred to the weight of expenditure over receipts, and said that guarantors could not always be asked to come forward. As to the increase of members, that also meant that more tickets had to be given away. He advocated having a two days' show, arguing that from newspaper reports people would learn of the show, and come in crowds on the second day, thus greatly augmenting the gate-takings, while the expense to the society would be but little increased. At the show of this year the flowers were perfectly fresh when the meeting closed, and he added that, if it was good for the Royal Horticultural Society to have a two days' Rose show, it was also good for their own. Mr. Pemberton desired an alteration in the date of the Temple Rose Show. This year, he said, the show was the smallest they had ever held. Within two days of the show many had said to him that it was not possible there could be a good show at so early a date, and they did not visit it. Then, again, it had been suggested that people had left town in either the first or second week of July, but he contended this was not so. The show, moreover, should be national in its representation, and not merely metropolitan. Mr. George Gordon seconded. By having a two days' show they would ensure, he thought, the greater support of country members, and more gate-money to boot. He pointed out that some of the provincial Rose shows lasted for three whole days, and concluded by saying that if the society had to bear the loss of £150 in one year the members might know what would happen sooner or later. Mr. Gordon desired to have Regulation II. expunged, but it was suggested that this should form a proposition by itself.

The next speaker, Mr. Frank Cant, took the opposite side to the two foregoing. He thought that the last Temple Show was far and away the best ever held. He asked: "Do the subscribers hail from the north or the south?" and answered by saying, the south, amid a conflicting chorus of "Yes!" and "No!" The flowers of southern growers were perfectly ready by July 1. Mr. Geo. Paul did not think it fair to country societies if the N.R.S. altered its date, because many societies would have fixed their date in consideration of the metropolitan exhibition. An alteration of date would mean a clash with others.

Mr. E. B. Lindsell supported Mr. Pemberton, and thought it would be wise, for the sake of midland and northern growers, if a later date was chosen. From a secretary's point of view, Mr. Mawley preferred the later date as likely to be the more successful. Mr. G. W. Cook thought it better to leave the matter in the hands of the committee until they had seen the benchers of the Inner Temple.

A country member here rose, and referred to the year 1893, when southern Roses were nearly past by July 8. Mr. F. Cant asked if he might make another remark, which was, that an early show be held one year and a slightly later show the year after. Some of the older rosarians pointed out that such was virtually the arrangement years ago. Mr. Pemberton's amendment, altering the date of the metropolitan exhibition in the report from July 1 to July 8, was now put to the meeting, when the votes were: 16 for, 17 against—a bare majority of one. The report having been so far discussed, it was adopted unanimously.

Mr. George Gordon now formally proposed that the exhibition held in the Temple Gardens extend over two days, and to enable this to be done, that Regulation II. be expunged. The chairman suggested that the Regulation need only be altered to read: "extend over two days." Mr. Gordon agreed, and his proposition was seconded by Mr. Pemberton.

Mr. Mawley demurred. He said that at the last annual general meeting this question was discussed, and *only five hands* were held up in its favour. He pointed out that, so far as gate-takings were concerned, the Royal Horticultural Society's earlier Temple Shows were very unsatisfactory and risky, but that latterly they were quite successful, thus suggesting that the N.R.S. might follow suit. They had not really given this one day's show a fair trial, and this year had been a very bad one for the show.

Mr. O. G. Orpen thought that if the N.R.S. started holding two days' shows the country societies would be doing the same, and as the majority of the exhibitions at the present time have to be got into about sixteen days, the Trade and amateur exhibitors could not afford to attend nearly so many. Following him was an unknown member, who said he would rather pay double subscriptions than that they should come to adopt the two days' show. Mr. F. Cant remarked that it would be necessary for exhibitors to double the number of their boxes and to have double the number of men in order to attend other shows. Mr. G. Paul was not in favour of the two days' show. Mr. Shea then put the proposition to the vote, when there were 16 for, and 21 against, a majority of five. Thus it would seem that the idea is making advances.

Mr. John Strange now proposed: "That the thanks of the society be given to the officers and other members of the committee for their services during the year." He expressed the opinion that the society was fortunate in having such an able and assiduous secretary and so excellent a chairman of committee. Regarding the distance which many of the committeemen had to travel he thought their attendances most exemplary, and the spirit they showed was most praiseworthy. Mr. H. S. Bartleet seconded, and Mr. Mawley responded, mentioning especially Mr. D'Ombraïn. He also commended the special work of the treasurer, and quoted some figures to show that the pulse of the society was true and good. The subscriptions in 1898 amounted to £373; in 1899 to £384, a gain of £11; in 1900 to £391, another gain of £7; in 1901 to £458, a gain of £67; and in 1902 to £566, a gain of £108.

The following alterations in Bye-laws 3, 5, and 7, and also in Regulation 3, to the effect that the word "secretary" be substituted for "secretaries" wherever the latter word occurs, was proposed by Dr. Shackleton, who said this was simply a clerical alteration. Rev. J. H. Pemberton seconded, and it was agreed to.

A discussion of some length turned upon a proposed alteration to Regulation 13. The matter had been in the hands of a sub-committee, but they had not been able to come to any definite conclusion. The notice, as given hereunder, was placed in the hands of each member present:—

"In the absence of any definite resolution being agreed to by the sub-committee appointed to consider the question, Mr. O. G. Orpen will propose the following resolution at the general meeting on the 11th inst.: 'That Regulation 13 be altered to read as follows—The Gold Medal of the society may be awarded to any seedling Rose or distinct sport, whether raised in the British Isles or elsewhere, and the variety for such an award must be exhibited by the raiser or by the introducer, and the Medal shall go to the exhibitor. If exhibited by the introducer, the Medal must go to him as such, and the raiser's name and address, if known, must also be stated on the award. No variety shall be eligible to receive a Gold Medal if distributed earlier than *May 1* of the year in which it is exhibited for such an award, and no variety which has won the Gold Medal at an exhibition of the society, can again receive this award at any of the society's exhibitions.'

Mr. Orpen said the matter opened up a wide field. The sub-committee agreed that a Gold Medal should be given to meritorious new Roses. The next matter was as to when new Roses were to be introduced. Mr. Orpen had proposed May 1, as this would equalise growers who may have secured the right of use of a certain stock, and they would then be able to show in good condition for a Medal the next year. The chairman stopped the speaker in order to get a definition of the word "introducer." He asked that, if

two or three buyers secured a stock of the one variety, who would be "the introducer?" Mr. G. Paul suggested using the words "sender-out," as being more expressive. After discussion, however, no agreement was come to, and the matter went back into committee for general consideration, and to be brought forward at the next annual general meeting.

Mr. Mawley read letters from Glasgow, desiring that the date of the northern exhibition be made Wednesday, July 15, instead of Thursday, the 16th, that date being less suitable as a visitors' day. The change of date was agreed to. A Gloucester member, Mr. Conway Jones, said he had been deputed by his local society to ask the National Rose Society whether it could fix Gloucester as the place for its southern show in 1904. Mr. Mawley replied that Sutton, in Surrey, had already been mentioned for 1904, but they would bear Gloucester in mind. The meeting then terminated with a vote of thanks to the chairman.

#### The Annual Dinner.

Following the general meeting, which lasted from half-past three to half-past five, was this pleasant social gathering of rosarians and their friends. A number of those who had attended the afternoon meeting were unable to stay to dinner, but others evidently took their place, and each chair around the tables was occupied. Mr. Edward Mawley, the secretary, was in the chair, and on his right hand was Mr. Harman Payne, foreign corresponding secretary of the National Chrysanthemum Society. The tables were decorated with Roses contributed by Mr. Geo. Paul and Mr. Geo. Mount, and dishes of Apples from Mr. Geo. Bunyard. The names of the Apples had been also sent, and there was quite an examination at the writer's part of the table, on the respective flavour-merit, of some of the varieties. Ross Nonpareil was accorded a high place as a small dessert Apple. The arrangement of the Roses, too, was of interest, inasmuch that they separately appeared to be mystically standing erect, or inclinedly, without any support. The secret was that half-needles had been fixed here and there along the centre of the table, and the soft base of the pithy stems of the Roses had been pressed down upon them. The idea is novel, and well worth the noting.

After the loyal toasts were acclaimed and drunk by the company, and various vocal selections rendered by the Venetian Part Singers and Madam Marion Harris, the chairman proposed a toast to the National Rose Society. In his remarks he stated that the founder of the society was absent on that occasion for the first time during twenty-five consecutive years. Nor was Mr. J. D. Pawle able to be among them, whose well-known presence had hitherto been relied on at the dinner. Mr. Mawley regretted also the absence of Mr. Cecil Cant, and trusted that he would soon recover from a dangerous trouble. Those suffering from colds, fashionable at this season, included such warm supporters as Mr. George Bunyard, Mr. George Mount, and Mr. Jefferies, and who were unable to be present; but he was pleased at the same time to see so many others around him in this "Christmas-Rose-like" weather.

Mr. Mawley then went on to say that it was, naturally, rather galling, after a quarter of a century, to find their expenditure exceeding their income. The society had had a peculiar career. Until two years ago they had jogged along, leaving the risks of the shows to others; but now they had started a speculative "business." They had an increasing membership, and soon there might be 1,000 on the books.

He told a story in contradiction to the usual advice "to cut your coat according to your cloth," the moral being that the coat might thereby be either too small or much too large. The adage must not be taken too literally. Nor must the National Rose Society's regulations be accepted ad verbum, for they had one which said: "All flowers must be staged as cut from the plants," and the chairman thought many of the flowers would look poor indeed but for the quarter of an hour's dressing.

Mr. Mawley said their "speculative show" was very expensive, amounting to £640 during the last two years. Turning to the question of catering to the taste of the non-exhibiting member, he thought they should not forget that it was from the ordinary grower that most of the prizes came. Such members were not always fond of flower shows, but they were fond of those little books the society provides—books on Rose culture. Roses are exceedingly popular at the present time, and this was because gardens now-a-days might be all Roses, and in bloom from early summer to winter by a wise selection of the different sections.

The toast of "The Visitors" came from Mr. G. Paul, coupling with it the name of Mr. Harman Payne, who, as Mr. Paul banteringly remarked, had been reported to have said that the N.R.S. was mostly composed "of old maids and country parsons." Mr. Harman Payne (an Officier du Société Mérite Agricole), in his charming style, soon put himself right with the members of the Rose Society. The toast of the "Horticultural Press" was proposed by Mr. F. Cant and responded to by Mr. G. Gordon. The very pleasant meeting broke up about nine o'clock.

#### The Horticultural Hall.

I trust I am not too late to take part in the debate on this matter. What I and a good many others desire to know is, Will the average gardener assist the funds? Unless he be a Fellow, there are hundreds of good gardeners who have never seen the inside of the present hall, and are just as likely never to see the inside of the new one; yet they would give their "brick" for the sake of "our common cause," the advancement of horticulture. I think there should be a museum somewhere in the new building, and a meeting room for country gardeners who are not Fellows, but who are willing to subscribe to the new hall. We should have a hall for the United Kingdom, not a metropolitan affair, but a headquarters for all genuine "blue aprons," whether as head gardener to a Duke, or a single-handed gardener to a doctor. Is the Council willing to offer outsiders (I mean non-Fellows) something in return for their "bricks"? I propose that every gardener in a situation gives at least a florin, and every man under him a shilling; he, or they, to give more if so disposed, and where possible to ask their employers also to subscribe. I think that if the Council would make it clear what benefit the non-Fellows would derive from the hall, "bricks" would come in much quicker, and maybe a bit of granite for the front. At any rate, the writer's "brick" and his men's are waiting to see what the Council offer.

Bournemouth.

C. S. RITCHIE.

#### The Bothy Plan Competition.

I have taken great interest in the bothy plan scheme from the beginning, and hope that the idea will be a success, and will find many competitors. The higher amount stipulated in your last number as the maximum cost of the building will have freed some competitors from difficulties on this point. [Note that the cost must not exceed the amount stated, though it may be less.—ED.] As you say, it may not be a difficult matter to draw a suitable plan, but it, nevertheless, requires great forethought, and such work, it must be remembered, is the means of gaining a livelihood for many persons. To persons not acquainted with building it is not quite so easy as it looks; the part I cannot comprehend is what is termed "general items." How is a person quite uninitiated to give an estimation of the general items of a building when there is such a lot to know about the business? Why, if the "common" journeyman can do such work off-handed (?) he would, I venture to suppose, find work in another atmosphere! [See footnote.—ED.] There is much to be taken into consideration to be able to give a satisfactory estimate of general items, and is unusual in such a case (?). A certain figure is stated, and then circumstances make the profits variable, and it is the profits that a business man must look to. I asked two men, an architect and a builder, what they would charge me for "ideas" and "a plan"; they both said the lowest they could do was half-a-guinea. How many bothyites can afford to pay that sum for help, and get no prize perhaps? It will be those fortunate ones who have friends in the line that will have the best ideas, and therefore stand a chance of obtaining a prize; but I do hope those who love the work and yet cannot afford to pay high prices, or have no influential friends, will send in a plan, for it is plans from the bothy that will be looked for. Mr. Editor, is that not so? I trust it will be those plans that will be considered, with respect to the circumstances under which they originated; for it is hardly possible for a gardener to be able to compete with an architect, or vice versa. By all means state a figure as to cost, but if "general items" is made law I know one who will be thrown out.—W. H. RABJOHN.

[The above is a remarkable letter in this, that the writer of it seems to have missed the points which we have tried to lay down in our solicitation for a bothy plan. We agree that it requires "considerable forethought" in order to produce a meritorious plan, and we had no conception that "a common journeyman" would ever think to produce a plan "off-hand." It was partly in order that competitors might have time to duly investigate the matter—which experience should be invaluable to a gardener—that the final date of closing the competition was deferred. Our correspondent is wrong in saying that it is unusual to furnish an estimate of cost when a draughtsman submits a plan. What value would attach to a plan if it did not qualify with the stipulated cost? In his next point, the

writer informs us that: "I asked an architect and a builder what they would charge me for 'ideas' and 'a plan,'" and this on the face of what we published last week, that "the sender will alone be held responsible for it." We sincerely trust that many of the plans will come "from the bothy," and hope that they will be individually the work of the person who sends them, else where can the honour be placed? What we have termed "The general items of cost," includes the bricks and stones required, the timber for the construction, and plaster for the walls. The bothy equipment would not be included in the cost of the building itself.—Ed.]

### Illegal Showing.

This question, unfortunately, is not so much that of where illegal practices are, as it is that of where they are *not* in vogue. As Mr. Raillem hints, honest men as exhibitors are very backward in coming forward in the matter; so much so, indeed, that some who have found their efforts handicapped by the clubbing processes of a clique have dropped out of showing altogether, and others have copied the nefarious tactics in order to fight an enemy with his own weapons. I do not think my experience is unique, but I do think that some may consider such assertions too vague, requiring substantiation by facts. These I am quite prepared to give, under the seal of confession, to our Editor, and in such a manner that he can, if necessary, test the *bona fides* of my statements. "R. M.'s" letter, on page 541, is very much to the point; but he, too, ignores an important factor in the question, viz., those who have the evidence are generally minus the power and position to use it; or, at least, that is their feeling on the matter. Mr. Raillem, on same page, generously recognises this, inasmuch as he calls it "a serious matter for one in a dependent position to bell the cat," and very pertinently deplores "a little want of pluck" originally. However, it would, I think, be as hard to trace its origin as it is to predict its end. Probably it began at the first flower show, and, possibly, it will only end with the last; but, doubtless, Mr. Raillem's suggestion "that honest men in each society put their heads together, stand by one another, and put forward a general motion without reference to any individual case at the annual meeting" would be a step in the right direction; and if they would, or could, induce a few of the big sinners to join them it might be another, for to give a man credit for what he is not sometimes stimulates him into being what he ought to be. A roundabout method, truly, but, in view of past discussions and abortive results, no shorter cuts to integrity in showing present themselves to the mind of—K. D.

It is not only too true that illegal showing is too much practised, and all who have the interests of fair play in competition should endeavour to bring the force of public opinion to bear in trying to check it. Nobody who has had anything to do with shows in an official capacity, or who is constantly coming across other horticulturists who are exhibitors or friends of theirs, can say that this illegal showing is non-existent, or only carried on to a small extent. It prevails in many show districts, and is so insidious in its ways that it is almost impossible to check it. The attempted remedy or precaution, taken by many societies, of reserving power for the committee to visit the gardens of exhibitors is but little called into operation, for the simple reason that it is difficult to secure anyone to perform this invidious duty. In many shows the greater part of the work after the entries have been taken falls upon the secretary, and he has no time to visit gardens then. At the same time, I have seen this power exercised to advantage, and can in particular recall one occasion where a visitation was made with a good result. One of the vice-presidents of a certain show visited the garden of an exhibitor who had entered Asters, and found that it was impossible that any of the flowers in his bed of these plants could be open in time for the show. He made no remark until the morning of the show, when he observed the exhibitor in question setting up a board of capital Asters. He spoke to the man, and told him that he had not grown these flowers, and that he would lodge a complaint with the secretary if they were not taken away at once. The exhibitor waxed indignant, but the vice-president was firm, and the flowers were taken away before judging began. It is a pity that the complaint was not formally lodged, as the result would have been good for all concerned. This system of visitation, while good enough for small local shows, is impracticable for open ones, as no plan of the kind could ever be carried out with them.

But I do not think that the honest exhibitor need object to this visitation; in fact, in many cases he would welcome it, as he is sometimes wrongfully accused in local gossip. I know of a recent case in which a show secretary heard some men discussing an exhibit of a certain vegetable, which they declared could not have been ready for cutting at that time in the district. The official interposed, and told them that the second prize one

was grown in a garden close to his home, and that he could show them the plant from which it was cut. Unfortunately, there are many men who aid and abet the dishonest exhibitor, and who seem rather to take pride in telling that some of their vegetables, fruit, or flowers were away to such-and-such a place to be shown at a flower show by a certain person. There are also some trade growers who will supply exhibition blooms without asking any questions, but knowing all the time that they are for competition. Now, all these things point to the need of preaching a higher code of what we may call "show morality," and the thanks of all who wish well to horticulture are due to the opener of the subject in your lively columns devoted to "Our Readers' Views." It is best to call a spade a spade, and to say that no amount of sophistry will alter the nature of the practice, which is simply a fraudulent one. The winner of a prize by such means is on a par with the criminal who obtains money or property under false pretences.—A SECRETARY.

### Sweet Potatoes and Yams in the West Indies.

During the period of stress which our sugar-growing Colonies in the West Indies are passing through, pending the abolition of the foreign sugar bounties, the attention of the planters has naturally been given to other produce. In Barbados great success has been achieved in the cultivation of Sweet Potatoes (*Ipomœa Batatas*) and Yams (*Dioscorea sativa*) of the very best quality, and an endeavour is now being made to introduce these into this country. The Sweet Potato is a cheap and palatable vegetable, but a good Yam is a positive luxury. During a long residence in London I imported several barrels every year for my own use, and out of the numerous guests who tasted them at our table there was not one who did not highly appreciate them. I may add that here the flavour is even more delicious than in the West Indies, as butter, which is a vital ingredient in a well-cooked Yam, is so much better. I am returning to Barbados almost immediately, but any information on this subject is easily obtainable from the regular importers. Receipts for various ways of cooking both Sweet Potatoes and Yams are sent out with every parcel. I shall esteem it a great favour if you will kindly insert this letter in your journal.—FORSTER M. ALLEYNE, Member of the Legislative Council of Barbados.

### Pear, Gris de Chin.

Your readers may possibly be interested in having an authentic account of this Pear, which received an Award of Merit at the latest meeting of the Royal Horticultural Society. [Owing to our having had a faulty list of awards from the Fruit Committee's table, the Pear was not recorded in our report of the show.—Ed.] Tempted by the voluminous Pear catalogue of Mr. L. Van Houtte, Ghent, some thirty years ago, I closely analysed the glowing characteristics of what the catalogue extolled as the "crème de la crème" of Pear individuality by the most persuading of adjectives. I knew all our most prized favourites, and yet found the merits of such as, for instance, Marie Louise, Thompson, Doyenné du Comice, &c., sorely occulted by seductive characters attributed to quite three dozen sorts out of an army of not less than 800 varieties, that former selection being entirely unknown to me and to British pomology generally. I ordered a tree of each of the selection of some two scores of a series of reputed prodigies, but, alas! never came to realise my dream of the future possessor of exquisites. One after the other these precious Pears were discarded as worthless, and the only gem was Gris de Chin, now brought to general notice by me. A few years after my early acquisition even this genuinely meritorious subject disappeared from the Belgian catalogue, and I never noticed the name anywhere since. As we are told by some other nation that Shakespeare's worth was made known to us by them, might be we can emulate it by re-exporting Gris de Chin to Flanders, even with greater justice.

Being told of the disappearance, for purposes of belated reporters, of an exhibit that had been identified but had emerged sadly diminished from under the hands and palate of a whole score of conscientious and appreciative judges, who, just for appearance sake, left one specimen on the plate to my own certain knowledge, and which was undisturbed even an hour after, we can only surmise that a December wasp, if not hornet, made off with the balance and disappointed your reporter. For, as it happens, it is a fact which speaks volumes as to the excellence of the fruit—the presence of much saccharine in this variety supplementing its highly pronounced richness of flavour and juiciness, its buttery character (although the product of a bush in the open), all elements which rendered it an object of lively interest to wasps—when in September-October the crop approached maturity these same wasps actually despising Marie Louise, Doyenné du Comice, and Thompson growing by the side in excellent condition.—H. H. RASCHEN, Sidcup, Kent.

## Pruning.

Showers of leaves in many shades of colour, from golden yellow to hues of russet brown, are falling on lawn and meadow, in wood and plantation. The hedgerows are thinning rapidly, and soon the arms of the giant Elms and Oaks will be flung abroad, bare and devoid of their leafy mantle. At such a time the gardener turns to thoughts of saw and knife, and perhaps also a pair of secateurs. It is necessary that one and all be in readiness when the time is at hand. Some of us would fain see a far greater portion of this work of pruning performed before the foliage commences to fall, but too well do numbers of us know how many other things there are that cry out for attention when we would be pruning which cannot be left undone.

For several years I have noted the advantage derived by trees that have been summer-pruned, and have not hesitated to take whole branches from old basin-shaped trees, both Apples and Pears, when in full leaf. A better idea of space needed may in this way be obtained, far better than when the trees have lost their foliage, and there is nothing but bare twigs and stems for the workman's guidance. As for the dreaded bleeding sometimes talked of, I have seen nothing to fear in this direction from any reasonable operations carried out in summer. This summer-pruning has always tended (at least, in my experience) to thoroughly ripened wood and highly coloured fruit. It, of course, is only within the bounds of common sense to expect such results, from the greater freedom with which sun and air may thus exert their genial influences on growth and fruit. Provided there is a fair balance between root and branch, and summer-pruning is carried out so that the back or basal buds are not forced into incipient growths, that must of necessity be insufficiently ripened, there need be little fear as to crops if the weather at blossom time be at all favourable.

Many times I am asked: "Will you come and look at my Plum tree?" or, it may be, "my Apple tree?" Certainly, one is always willing to oblige friends in these matters, but I always endeavour to dissipate any mystery there may be in the minds of people as to this matter-of-fact operation. Pruning seems to me a matter that calls for the exercise of plain sense and decisive action as much as, or more, than any other work a gardener has to do. The skill which comes from practice and observation, and which is requisite where large numbers of trees have to be dealt with, is not so needful to the amateur as may at first sight appear. We all know that the branches of a tree should be disposed far enough apart for air and sun to pass freely through and amongst. With a little thought it is not a difficult matter to steer a middle course between the method of him who snips a bit here and a bit there, his trees ultimately becoming a thicket of unprofitable growth, and he who mercilessly hacks and saws, leaving great jagged wounds and gaps, thus utterly spoiling the contour, and even appearance, of his trees and bushes. It should be remembered always that after pruning with a saw the knife should be brought into use for paring and smoothing the rough surface left by the saw; this is of great assistance in healing the sore place. In the matter of thinning and opening the centres of trees which have been for some time neglected (this, of course, is an operation more frequently needed by old trees), it is wise to give a thought in the growing season after they have been so treated. I have a tree in mind, which two winters ago was thinned out in the manner so often advocated in these pages. At every place where pruning was done there have sprung from three to half-a-dozen young shoots. Now, the last stage of this tree is worse than it was before. These young shoots should have been ruthlessly torn from their sockets when a few inches in length, and much trouble would have been thereby saved, besides the benefit that would naturally have accrued to the tree.

I have thus far spoken of outside work in connection with pruning. I should like to supplement these remarks with a few observations as to inside work in relation to Vines. We may see, in fact often do see, old Vine rods spurred back year after year without the slightest attempt being made to bring up young canes from the base of the old ones—a comparatively easy matter. Some few years back a house of Black Hamburghs came under my notice, in which the Vines had been cut closely back on the one bud idea for many seasons. They had, indeed, become so decrepit that they would scarcely produce Grapes at all, yet by lighter pruning, viz., shortening the laterals to where a good plump bud could be found, some very fair bunches were produced in the first season by the old stagers. In the meantime young rods were started from the base, and as these attained their full measure of strength the old rods were gradually taken out, the bottom spurs being first cut clean away. Proper treatment was meted out to the roots, and in a few seasons the regeneration of these Vines was complete. Many would be inclined

to say: "Less trouble to take them out and replant new canes." Except in the case of very old Vines I am doubtful if this would be true.

There is also the matter of root-pruning, which has received no lack of attention from time to time in the Journal. It must ever be remembered that, prune we never so well and wisely the branches of our trees, we but aggravate the evil of superabundant growth if the roots are too active or are working in an unsuitable medium. Often attention applied to the roots will prevent in a great measure the use of the knife on the upper portions of fruit trees.

In conclusion, I can only say to the novice that a knowledge of the difference between wood and fruit buds must of necessity be acquired. That some thought must be bestowed on the placing of the top bud, so as to mark the direction of the future shoot. That strong growths should not be pruned as severely as weak ones, and, above all, sound common sense must be bestowed on each tree as to its form and shape in the time to come. There is nothing, either magical, miraculous, or mysterious about pruning fruit trees, and this may be discovered by those who are willing to give time and labour in the pursuit of experienced knowledge.—J. W.

## MALMAISON CARNATIONS.

The photograph of a house of Malmaison Carnations which we reproduce came to us from Mr. G. H. Cook, gardener at Milburn, Esher, Surrey, who promises to detail his method of culture in a subsequent issue. In his first letter to us he writes, saying:

"I am sorry, but the photo gives one a very faint idea of the beauty of those blooms when this was taken. There were some 600 plants in the house, bearing on an average four blooms each, and measuring 4in to 5in across. These are the favourite flowers of my employer, the Hon. H. Bourkes, and consequently we make a speciality of them. So far we have had excellent results from our labour."

## Herbaceous and Hardy Borders.

### Stocktaking.

Don't read this if you have up-to-date hardy borders—the best of everything in them, and everything of the best. "Why not?" Well, given the above most desirable state of things in that most desirable section of latter day gardening the few hints proposed do not apply, for the happy man who has the best can have no better. Less blest ones may, possibly, dismiss the matter by saying they don't want to go humbugging around their borders just as things are going to rest, let 'em rest in peace. Precisely so. R.I.P. It is not the season for dunging and delving, and worrying up things that want to rest; but, mark you, it is the time for stocktaking. Be in time; hurry up with a fistful of labels ere things are indistinguishable, and you have to poke about for some precious bits, and "don't know where 'e are," perhaps never will know, only inasmuch as your destroying angel will account for it with "must a got chucked out with the rubbage, mister."

### The Migration of Plants.

It's strange how good things will disappear. Stranger still, that with all our scientific research there is yet much mystery about the migration of plants. Old Jack L—, who was very fond of "yarbashus plants," with all his simple ignorance knew a good deal more on that subject than the clever gardener who was his, as well as the writer's master, when a lad; so there was many a surreptitious chat over "Pattakees," "Genshers," and "Penstemmers"; seasoned by an old traveller's tales about rare things in "furrin' parts." Our friend of early days had, in his early days, been "all down the Merrygeranium Sea," consequently had due respect favouring a friendliness which culminated in "Come over a Sunday, lad, when m' darter's at home, and see my bit o' bloom." The dual attraction resulted in the two mile walk to old Jack's; tea with the "darter," and an inspection of the "yarbashus" beauties in the homely cottage garden. Strange, passing strange, but there were just such things in it as had disappeared from the Hall

gardens; a striking testimony to the migration of plants impressed by a sagacious wink from old Jack, which might have meant anything or nothing then; now it means a good deal. It was just such a wink and a nod that led at this year's bedding out to a dive into a disused upright boiler, the magnetic properties of which had attracted some of our best bedding plants into its capacious stomach on their journey from the frames to the front; so quietly, too, that the carriers "didn't know a 'a'p'orth about it."

#### Propagation.

Legitimate disappearance for want of a little forethought of many so-called hardy plants is apt to occur, and perennial propagation to keep up the stock is absolutely necessary. This is essentially the case with Pentstemons, and cuttings of these put in a frame under a north wall now, with such odds and ends as commend themselves for similar notice,

ladyship's gardener can trot over on Shank's mare for a few roots afterwards, muttering, perhaps, "M'lady's gone mad." However, he soon goes mad too, and there is a good deal of method, some right, some wrong, in their madness, which never assumes its most violent form, perhaps, until some "chiel" goes taking notes and "prents them"; then matters "gang awa'" fast and furious.

#### Borders, Beds, Rockeries, and Rooteries.

All sorts and conditions of planting, suitable and unsuitable to the positions and surroundings, are frequently in evidence; often sufficiently unsuitable to seriously detract from the show. The planter cannot consistently carry out all the natural freedom and grace characteristically inherent with the growth of hardy plants in violent opposition to harmonic lines without presenting incongruities; hence, in the formal garden, a certain amount of formality must rule.

Malmaison Carnations.

will make nice little plants, and be found real handy for filling frontage next spring. Root division at that season is, par excellence, the method for propagation of true herbaceous plants, and with due thought having been given to timely labelling, the weeding out of poor varieties, selection, division, and preservation of the best, all tends to result in the survival of the fittest. A friend who has worked on this principle for years has now the finest stock of superior kinds the most covetous could desire. Great beggar and generous giver as he is, the envied collection has not cost his employers one penny; all of which is, of course, very bad—for trade; yet self-made hardy borders are sometimes like self-made men, if not made that way they are not made at all. What an entrancing theme it is this hardy plant "mania"! Let but one man or wo—(I mean lady) be badly bitten in a locality hitherto exempt, the infection spreads as fast as her ladyship's landau can bring home the report of Mr. or Mrs. So-and-So's "lovely plants," or her

Justice to the plants must be tempered with mercy for the surroundings; and so much tempered, perhaps, that the subject is shorn of that beauty we look for in conjunction with it. In the kitchen garden, so often comprising the utile et dulce by important central or other borders, not only for ornamentation, but for a supply of cut bloom, the more prominent plants, such as perennial Sunflowers, Michaelmas Daisies, and others of that ilk, with a mixed planting of many things tender and tropical, annuals and biennials, are not only useful but essential to the end in view. In the flower garden proper, ornamental display is the object, and with possibly classic outlines which cannot be ignored, formality is still more in evidence, and it is only when one can escape from trim edges and prim geometrical designs that the lover of hardy plants feels free to have his fling. What a glorious thing is freedom! And what a happy exposition it is possible to give with bold, irregular, marginal outlines, composed, for preference, of

rough, rocky boulders forming bays, promontories, plateaus, mounds, shady nooks, and sunny crannies, each suggestive of suitability for particular occupants, either as protection for the weak or imprisonment for the aggressively strong. On an extensive scale, giving a variety of aspects, heavy tree roots and rough logs can be impressed into service; in shady angles or moisture-holding spots these make a break, and are admirably adapted for Ferns, amongst which *Osmundas*, the *Struthiopteris*, and *Adiantum pedatum* may well find a place.

#### More Propagation.

There is one excellent adjunct to hardy plant culture which has been inadvertently passed over, viz., a Burbidgean nursery for seedlings. It is for just such things as may, or may not, grow; and may, or may not, be useful. The groundwork of the method is a bed in some quiet corner, raised for preference, and edged with substantial stones. The filling in is done at all times, and pretty with all things in the form of ripe seed pods gathered here, there, and everywhere among the hardy plants whilst walking round. Some particular things, such as *Meconopsis Wallichii*, claim of necessity their rights to a seed pan or box under glass. In a Burbidgean bed there is no labelling, no fuss, and from this stock collection many a good thing can be extracted when identified, and transferred to its proper position in the garden, or in somebody else's garden where beggars abound. "Finished?" No. There is no finish to this subject, and for those who, having all and knowing all, heeded not the preliminary advice no apology from—QUIZ.

### STRAWBERRIES IN POTS.

The commencement of swelling in the crowns usually marks the advent of aphides in the developing leaves and trusses. A close scrutiny must be made for these pests on the earliest started batch of plants, which are now starting from the crowns, fumigating repeatedly until the pests are exterminated. The temperature may be advanced a few degrees by day, but it is advisable to seek this from sun rather than procure it from fire heat. A temperature of 50deg at night is quite sufficient for the present, and 60deg to 65deg with sun, and a free circulation of air. This will insure steady and sturdy development, and the more slowly the plants are brought on the stronger the blossom and better the setting. This means relying greatly on sun heat, which is very uncertain during the winter months; therefore the plants have to be brought on independent of the weather, and as near the glass as safe, in order to secure a stout growth. Syringing the plants in the early part of fine days will be advantageous, also on fine afternoons, but avoid a close saturated atmosphere. Examine the plants daily, and apply water to all those which require it. A plant with the soil too dry cannot grow, but is wasted through exhausting the stored juices, and one with the soil too wet is stagnated, the soil being poor and the plant unhealthy.

Other plants should be started for affording ripe fruit in late March or early in April. There are now so many varieties that it is difficult to make choice of a few, so as to include the best. *La Grosse Sucrée*, true stock of Keen's Seedling, and *Vicomtesse Hericart de Thury* are not a great way behind the earliest in ripening, and are dependable, as also is *Royal Sovereign*. Noble and *Auguste Nicaise*, with *James Veitch*, will satisfy most people in need of a big crop and large fruit. Remove the decayed leaves, attend to the drainage, and, if necessary, rectify it, washing the pots clean. Loosen the surface soil and top-dress with rotten manure, rubbed through a half-inch sieve, adding about a pint of a mixture of three parts superphosphate, two parts powdered saltpetre, and one part gypsum to each bushel of rotten manure or rich compost. This acts well on the roots, causing them to push fresh fibrelets freely. The plants may be introduced to a Peach house now being started, or to a Strawberry house if one be available.

Plants for drafting to houses as started should be placed in frames, or in a house from which frost is excluded, so that they will be fit for work when required; but they must not be kept dry, and the pots must be plunged if there is danger of frost, as it is absolutely necessary that they be kept from damage of that kind. Plants for introducing later on will be quite safe in their quarters out of doors plunged in ashes to the rim of the pots, and a light covering of dry fern or litter may be given in severe weather, allowing to remain on whilst frost-bound, removing in mild weather, but not exposing frozen plants from beneath protection to the direct rays of the sun.

—G. A.

### The Time of Striking Cuttings.

The appetites of Chrysanthemists have now been appeased in the great floral feasts now just over, and consequently thoughts are turned towards the next, that of November, 1903. There always have been mixed feelings among growers as to the better time for striking cuttings to get the best results from their culture for specimen blooms, and it occurred to the writer that probably a "show of hands" in favour and against the practice of early striking may be useful to many readers. One may hear every season fresh resolutions made by almost every grower affecting some technical point of culture, and this season is not less fertile in such matters. Some resolve to proceed at once at the close of the shows to make a start with cuttings; others will defer propagation until January and February.

An example was related to me to-day (December 11) by a very good grower that his best blooms this year were from cuttings struck in February last. This fact would strengthen conviction that November's haste did not apply stamina to carry speed to a successful race. This opinion, however, from another grower would be met with rebutting evidence, and thus two extremes must continue, not only now, as in the past, but for all time. Some kinds probably succeed on a short lease, others fail; but the object of this note is not to argue for or against the practice, but to seek the opinion of others who are better qualified, and who have the interest of the flower fresh on the mind. Question: In which month is it best to propagate, to obtain specimen blooms?—W. S.

#### The Height of Some Novelties.

In a somewhat malignant manner Mr. Wells comments on page 537 on a bloom of Mrs. T. W. Pockett which I placed in one of my exhibits. Mr. G. Foster asked for information respecting one of the novelties recommended in a previous issue of the Journal, and what a comparison between blooms of a different variety, which I and another exhibitor had, has to do with the question I cannot comprehend, unless it be that Mr. Wells is anxious to belittle my efforts as a grower. I admit that the bloom of Mrs. T. W. Pockett was nothing to be proud of, but it was the best I had from many plants. If comparisons are permitted, I would say that even Mr. Pulling's blooms of this variety cut a poor figure by the side of my blooms of *Bessie Godfrey*. *Mafeking Hero* can hardly be termed a novelty, for I sent it out two years ago. Lord Alverstone in October I had on fine plants of less than 2ft in height. On later buds it was less satisfactory. Three fine flowers I placed before the Floral Committee of the R.H.S., but as they were past I suppose I over-rated the variety. Still, I consider very inferior blooms of some varieties have received the Award of Merit. The blooms of *Durban's Pride*, as noted by "Viator," were from plants which I imported the previous season from America. It is without question the same variety which Mr. Wells procured plants of from Australia.—W. J. GODFREY.

#### Date of Chrysanthemum Shows, 1903.

The societies that make an early announcement of the date of their shows are to be commended for various reasons. In the first place, other societies have then an opportunity to arrange their fixtures to avoid clashing with others in the same locality. Unfortunately, though, some do not pay heed to such forethought, but allow their society to run counter to another, with results not at all times in the interests of both, either financially or as an exhibition. In the second place, exhibitors have so much better an opportunity to prepare their plants when the date of the exhibition is announced ten or even twelve months in advance. The early issue of prize schedules, too, is a step in the right direction. I have known important societies issue their schedules four months before the date of show, and then complain if exhibitors did not support them in force. With a view of assisting the executive of societies who may see this note, I give the dates of shows already arranged for 1903 as far as I am able. Plymouth, November 3; Cardiff and Cambridge, November 4; N.C.S. and Birmingham, November 10; Winchester, November 11; West Hartlepool, November 17; York and Hull, November 18; Edinburgh, November 19; Bolton, November 20. The date given represents the opening day of each show.—E. M.

## Muscat Grapes.

As civilisation advances, the needs of individuals become more numerous, and their tastes more critical. What was looked upon as a luxury yesterday soon becomes an apparent necessity. In regard to the products of the garden a marked feature of recent years—in private gardens—has been the demand for fruit, vegetables, or flowers of high quality. By an inexorable law of nature the choicest and most delicately flavoured fruits are more difficult to cultivate than others which may be in some respects more showy, and although those which appeal to the eye by reason of their beauty quickly become popular, they do not retain their popularity like those which have the "hall mark" of fine flavour.

Turning to Grapes in particular, how splendidly those fine varieties, such as Muscat of Alexandria, Mrs. Pince, and Madresfield Court maintain their high positions among Grape connoisseurs. The former was perhaps never more popular than to-day, and the majority of gardeners in private places know pretty well that there is an increasing desire on the part of employers to be supplied with Muscats during as long a season as possible. This, of course, adds to the difficulties of gardeners, as it is not everywhere that the conveniences at command are suitable for growing this fine Grape largely, and even when cultivators have every advantage in this respect, very skilful attention is necessary to secure good crops regularly, for unless the Vines are kept up to what I will term the "high water mark" in regard to health, their cropping capabilities quickly deteriorate. At the present time that serious item, viz., the fuel bill, has to be considered in the above connection, because if Muscats are largely grown in preference to other varieties, considerably more heat will be required. Employers ought therefore to remember that if this best of all Grapes is to displace others in their houses, the expenses will be increased, and the high quality of the produce should therefore be considered as an asset of the garden.

Those who contemplate increasing their supply of Muscats will do well to consider the advisability of grafting or inarching that variety on their established Vines, rather than uproot them and replant, as Muscats succeed splendidly when grafted on other varieties; and although I have had many Vines so grafted to deal with, I could never detect any difference in the flavour of the produce than when the Vines were on their own roots. On the other hand, I am inclined to think there is an advantage in having a Muscat on a more vigorous rooting stock, as the principal reason why this fine Grape so often gets into an unsatisfactory condition is that the roots become inactive through mistakes in watering, or from other causes which are sometimes unavoidable. The rooting system of a Muscat seems to get out of order more quickly than that of other kinds.

There is no doubt in my mind that a far better rod is obtained in one season by grafting than by inarching, as I have tried both on Vines growing side by side; but when grafting is practised the old rod is, of course, sacrificed, and therefore no Grapes are obtained the first season. When, therefore, it is not convenient to sacrifice a year's crop, the following plan is an excellent one to pursue. Cut every alternate Vine down to within a foot or 18 in of the ground in January, and as soon as the sap is moving freely graft them. It is surprising what grand canes can be produced in one season from dormant grafts inserted in early spring. The remaining Vines should be inarched when the leaves are freely expanding. For this purpose it is necessary to have Muscat Vines in pots to inarch on the old rods. All that is necessary is to tongue the stock and the scion, fit them together carefully, bind firmly, and cover with moss, which should be moistened daily. In a couple of months the union should be complete, then the pot Vine can be cut away.

If a young shoot has been retained on this below the point of union, it will form a moderate sized cane during the season, and the Vine will be useful for planting the following season. The old inarched Vine will, of course, be able to carry a fair crop during the season, and the young Vine worked upon it should produce a good cane, which can be trained in a position where it gets plenty of light. In the autumn the old Vines should be cut away and the inarched

canes shortened severely or moderately, according to their strength. The following season the grafted Vines may be allowed to carry a moderate crop, and the second year the whole of the rods should be cropped according to their size and strength.

Before work of the above description is begun a little extra attention ought to be given to the border in the way of removing the surface soil down to a point where active roots are found, and adding fresh compost, in order to secure as far as possible vigorous growth. The advantage of employing grafting and inarching in changing the variety of Grape grown is that it is less expensive and quicker than by remaking the border and replanting, but it is only wise to adopt it when the Vines are already established, are healthy, and not very old. The above method, however, provides an excellent way of getting over a difficulty when a gardener who has Vines of other varieties in excellent condition, is requested to largely increase his supply of Muscats because they are preferred to all other Grapes. Other remarks on the culture of this "king" of Grapes I hope to advance for another issue.—ONWARD.

## The Bees' Hum.

A man who leads a busy life in our large towns, and lives in the suburbs, could not do better than commence bee-keeping as a paying hobby, and one which will provide a healthful occupation. Many years ago I met a gentleman who was storm-bound, like myself, and got into conversation with him. We conversed on many topics, and at last admired the beauty of a field of Clover, and he remarked how thousands of pounds were lost to this country annually because people would not take the trouble to keep and understand bees. This is perfectly true. When I lived in London a friend of mine came to see me, and one evening he told me many things about these wonderful insects, and concluded by saying he had cleared £6 from six bar-framed hives that year. From that day I made up my mind to keep bees so soon as an opportunity presented itself.

### What is Needed.

(1) Purchase a piece of black net 1½ yds long and ¾ yd deep, sew the ends together, and put a piece of elastic round the top, so that you can slip the veil tightly over a broad-brimmed hat. This will give you confidence when handling the bees. By way of warning, let me add, always wear the veil when performing any simple manipulation of the bees. (2) A good smoker is indispensable. (3) Buy a hive of any good maker, and then, as you gain experience and skill in the art of bee-keeping, make your own on the same pattern as the one you have purchased.

How to START.—The question often asked is, When ought we to commence bee-keeping? This is an easy question to put, but rather difficult to answer, as much depends upon circumstances, and the state of one's finances. Bees may in autumn be obtained for the driving, because, most unfortunately, the cottagers destroy the bees over the cruel sulphur fumes [?] in order to take the honey.

### How to Drive.

When the bees have been flying freely during the day, and if the evening be fine, then they may be driven with little fear of stings. Give the bees to be driven a puff of smoke, and rap the sides of the hive a little to frighten them and cause them to rush to the honey to gorge themselves. Wait a few seconds and then give them another puff. Overturn the skep and give a third puff to drive them down. place the overturned hive in a bucket, and if you have not seen the operation performed, put another skep of the same size over it, so that the rims coincide. Tap the sides of the hive with your hands or light stick, and in about fifteen or twenty minutes the bees will be in the top skep. It is best to drive two or more stocks, and mix the lots together. Take them to their new home, overturn them on the frames, which have previously been fitted with brood foundation—eight sheets to the pound—and cover snugly with quilts.—HYBLA.

## NOTES & NOTICES

### Illness of Mr. Cecil Cant.

Many of those rosarians who have come into touch with Mr. Cecil Cant, of Colchester, will join their sympathy with ours in learning of his critical condition through appendicitis. We most sincerely trust that soon he may again be completely restored, to assume the responsibilities of business along with his elder brother.

### A Meteorological Inquiry.

The First Lord of the Treasury has appointed a committee to inquire and report as to the administration by the meteorological council of the existing Parliamentary grant, and as to whether any changes in its apportionment are desirable in the interests of meteorological science, and to make any further recommendations that may occur to them with a view to increasing the utility of the grant.

### Notes from Hamilton, N B.

The frost which visited the district some ten days ago, and which appeared as if it came to stay for some time, has as suddenly and as unexpectedly left us to enjoy as best as we can the cheerless wet weather previously experienced. As I write, the rain comes down incessantly, and has done so since the same time yesterday morning, with only a brief interval during the night. Yesterday (Sunday) the sudden change which broke up the frost on Saturday morning culminated in a storm of wind and rain which approached the magnitude of a gale. But to-day the gale has subsided, and the atmosphere is colder, and I should not be surprised to see some snow supervene. The last few weeks have been remarkable for sudden falls and rises in temperature, and as the freaks of weather are often recurrent it is very possible that we shall have some more variable samples up till the end of the year at least. I note in last week's Journal that, on account of the mildness of the season, Strawberries and Raspberries were gathered in gardens in the sunny South. I, too, gathered about half a pint of the finest Raspberries we had this year on November 26 last. Flavour was almost as good, though a little more watery, as if pulled in the height of the season. In noting such curiosities it would be well to remark that the fruit was fertilised early in autumn, and on account of the general lateness of the season it necessarily took longer time to mature.—D. C.

### The Burmese Honeysuckle.

*Lonicera hildebrandiana* is the finest Woodbine that one could plant in a large conservatory. It must be a large structure to properly display it, and shelter is a necessity for this giant in Scotland, or at least in Edinburgh. But in southern England it seems to lead a happy life in the open. In the Edinburgh Botanic Gardens it is a very vigorous climber, which flowers from July to September. And profuse though the flowering shoots be, the fragrance is yet more noticeable, for it is sweetly diffused through a large and lofty conservatory. The large flowers are almost half a foot in length, and they are said to be capable of yet longer attempts. Freshly expanded, they are of a creamy yellow; but this colour soon deepens, and, passing through various and pleasing shades, arrives at a deep orange red, which colour marks their approaching flight to earth. This grand Honeysuckle is yet a new denizen of our gardens, as it is but four years since it was first flowered in this country at the Glasnevin Botanic Gardens in Ireland. In its native habitat it is a somewhat rare plant, and used like other choice things for the decoration of native temples. Its hardiness is owing to the altitude (about 5,000ft) at which it is found on the Shan Hills, and probably when plants of this Honeysuckle are more plentiful, it will be found to be suitable as an outdoor plant in more parts of the country. It was first raised from imported seeds, but cuttings of firm shoots 6in or so in length root freely in a warm propagating case.—D. S. FISH.

### Rev. H. Honywood D'Ombra.

It was most pleasant information that Mr. E. Mawley gave to his supporters at the annual dinner of the National Rose Society on Thursday last, when he reported Mr. D'Ombra's greatly improved state of health. Some of us had thought that the cold weather might have an undesirable effect on the condition of the veteran's health, but this, happily, is not so.

### Chinese Tree Planting.

The Chinese do many foolish things, but also some wise ones. Large proclamations have recently been posted throughout Yunnan exhorting the people to plant trees broadcast. The trees of Yunnan suffered terribly in the Mohammedan rebellion thirty years ago, and no earnest effort has yet been made to repair the loss. Official rank is promised to all who plant 10,000 trees or over, so that possibly the Chinese love of a button may lead in a few years' time to the changing of some of these barren hills into well-wooded and useful tracts of country. There are complaints that afforestation in this country does not always receive the attention it deserves. Could we not take a leaf out of China's book and give some reward to the man who makes two trees grow where only one grew before?

### The First Seed Catalogue for 1903.

Scarcely have the bulb catalogues ceased arriving before those devoted to trees, fruit, shrubs, and Roses begin to appear, and all of these are not recorded when Mercury's vanguard heralds the dawn of the new seed season. With the turn of the year the gardener considers his forthcoming seed-list, and soon the earlier sowings are made. Messrs. J. Veitch and Sons, Limited, are first in the field this year with an excellently arranged catalogue, which contains one of the best coloured plates (of *Streptocarpus*) we have seen in a publication of this kind. Following hard upon the aforementioned catalogue, comes another well-known guide, Messrs. Sutton and Sons' Amateur's Guide in Horticulture for 1903. It is one of those catalogues the professional gardener or amateur most prizes: it is up to its usual high standard.

### A United Agriculture, Horticulture, and Sylviculture.

The three arts, agriculture, horticulture, and sylviculture, are so intimately associated with one another that it is a matter of difficulty to determine where one begins, or another ceases to form a part of the chain which connects the whole three. Essentially there is no line of division, and therefore it behoves that every effort should be made to smooth any appearance of such that may exist, to alienate the natural fusion (if the term is admissible) when that should present itself. We are, perhaps, too much inclined to assign different parts to each, without in the remotest degree giving the least consideration to the relation they have to one another. In this manner we are, instead of coming in closer touch as years roll by, losing sight of our natural kinship, and our original common descent. This is by no means a desirable position for any one of the arts enumerated, for each is so peculiarly constituted that it necessarily requires all the combined force that unity of purpose can bring to bear upon it. How much more powerful would the authority and claims of each individually be, were each a component part of a grand united whole? Though almost insurmountable difficulties appear to lie in the way of such a united fellowship becoming a practicable force in the industrial economics of the country, yet there is no reason for thinking its accomplishment impossible. Perhaps it is through the instrumentality of the combined action of these three arts that our waste lands and denuded forests are to be planted and replanted for exigencies of the future. At least it would appear that private enterprise must sooner or later step in to save the situation, and doubtless this is very much as it ought to be. The continual croaking that the Government ought to take up the matter is not very indicative of wisdom, nor would such an action on the part of Government be a resourceful one for the nation. All private enterprises, we know, are a source of wealth to the nation; Government concerns are not invariably so, and in this instance could hardly be expected to be. Therefore, nobody is more fitted for the great work which must be effected in the future than the body which I beg to designate, "The Royal United Arts of Agriculture, Horticulture, and Sylviculture, of Great Britain and Ireland, &c."—ALBION.

**Chester Paxton Society.**

It has been decided to hold the next exhibition of fruits and Chrysanthemums in connection with this society on Wednesday and Thursday, November 11 and 12, 1903.—G. P. MILN.

**Weather in the North.**

The severe frost of the previous week declined in severity, and gave way on the 10th. Since then the weather has been dull and cold. On Sunday a gale from the south raged all day, with heavy rain. Monday was also dull, but fresh and fair.—B. D., S. Perthshire.

**Carter's "Vade Mecum."**

This apathetical land of ours, much to the annoyance, we should think, of its ever-present detractors, sometimes takes the lead in business as in art. Messrs. James Carter and Co.'s new seed catalogue is a case in point, for we have yet to see the foreign nursery catalogue that contains twenty-four coloured photographs, as this does. The size has been altered to more convenient proportions, which marks another change in the right direction. The catalogue is a work of art, as well as one of great value.

**Johannesburg, Transvaal.**

Over and around Johannesburg severe hailstorms fell early in November, damaging to an enormous extent the fruit and vegetable crops, as well as annuals just recently planted out. The hailstones were about the size of a pigeon's egg, but in some districts they were not so large, and in these cases the damage was not so great. One nurseryman and florist estimates his loss at over £2,000. After the storm not a Strawberry could be picked without a deep gash in it, and in the worst parts very few Peaches and Apricots will be pulled but what are damaged. The Vines also received a hard knocking, and the ground around them was quite green with leaves and bunches of Grapes. The fruit crop is a fairly heavy one, and was just on the point of ripening when the storms, which lasted no more than fifteen minutes each, burst over them, and in the shops and market little fruit is seen in an undamaged condition. Tomatoes and Melons were almost ruined, and Cabbages and Cauliflowers looked as if so many Mauser bullets had been showered upon them. Fruit in large quantities is now coming up from the Cape and Natal.

**Sugar Beet and Sugar Cane.**

Sugar Beet is grown in various quarters of the globe, and in vast quantities. The discovery of the presence of sugar in Beet-root, and the first experiments for its production, were made in Germany during the latter half of the eighteenth century. In 1747 Marggraf read a paper before the Berlin Academy of Sciences, and showed that he had obtained, by means of alcohol, 6.2 per cent. sugar from white Beet and 4.5 per cent. from red Beet. After the peace of Aix-la-Chapelle, however, the Continent was flooded with cheap British Colonial sugar, and the attempts to manufacture Beet sugar were abandoned until towards the end of the century. Achard and Hermbstadt resumed the experiments, and, assisted by the then prevailing Continental blockade, succeeded in laying the foundation of the German Beet sugar industry. The circumstances were certainly favourable, as the price of Cane sugar rose, for example, from 1s. per lb in 1805 to 5s. 6d. per lb in 1811, and Napoleon I. gave the infant industry his special assistance and protection. After his deposition, however, a great reaction took place, as the great majority of newly-founded sugar works were compelled to close owing to their unsuitable situation, the cessation of State aid, and the fall in the price of sugar after the close of the Continental blockade. About ten years afterwards the forward movement began again, and, aided principally by chemical and agricultural science, raised Germany to the position she occupies to-day as the greatest sugar-producing country of the world. There is no doubt that the bounty system has also most materially assisted the growth of the sugar industry, but science has had a very great deal to do in the matter, and the question is whether science applied with equal thoroughness might not do as much for the original source of sugar, the Sugar-Cane.—("Grocer.")

**National Sweet Pea Society.**

The annual general meeting will be held at the Hotel Windsor on Monday, 29th inst., at 4 p.m. Agenda: To receive the report and balance-sheet, election of officers and committee, the show in 1903, any other business.—HORACE J. WRIGHT.

**Appointments.**

Mr. William Keay, for the past seven years gardener at Westertel, St. Andrews, Fifeshire, as gardener to Walter Cunliffe, Esq., Headley Court, Epsom, Surrey. \* \* Mr. F. H. Shinner, late foreman at Osberton House, Worksop, Notts, as head gardener to Lord Arthur Butler, Gennings Park, Maidstone, Kent.

**National Amateur Gardeners, Liverpool Branch.**

From the excellent attendance of members and friends of the above branch at the annual social evening held in the Common Hall, Hackins Hey, on Wednesday last, it would appear that this useful branch is now on a more firm footing than on any previous occasion in its history. In the unavoidable absence of the president, Mr. A. W. Ardran was voted to the chair. There was a high-class musical programme submitted; Mrs. Robins being responsible for it. The artistes were Mesdames Reynolds, L. Smith, C. Smith, Gray, Laurenson, Thorn, Ash, and Dodd, and Messrs. E. Smith, Porter, Guilbert, and R. Pinnington. Light refreshments were provided during the evening under the supervision of Mesdames Paddock and Stevenson, assisted by a willing band of helpers. Votes of thanks were passed to the chairman, and to Messrs. Frisby, Dyke and Co. for the decoration of the room.—R. P. R.

**Humber Brand Insecticide.**

A few weeks ago we received a sample cask of this insecticide, and for trial placed it in the hands of a highly successful practical gardener, who kindly reports as under:—"Though of modern introduction, this has already created a good impression on those who have proved its efficacy. It would appear to be a highly concentrated solution of insect-destroying chemicals, pleasant, rather than offensive, to the user, and certainly rigorous in its action on the lighter side of insect life. Green and black fly, thrips, and even mealy bug fare badly when subject to an immersion of this Humber Brand in suitable strength. No apparent injury resulted to tender leafage, and it is our opinion that it is a preparation destined to do much in the future dealing with greenhouse troubles in the insect world. It certainly claims originality in name and substance, and its first trials are more convincing than many that have come before us."

**The Calderstone Estate.**

I have in these pages from time to time referred to the good work that is being carried on by the Liverpool Parks and Gardens' Committee, the last of which was the purchase of the fine Calderstone estate, and which is still in charge of the veteran, Mr. W. Tunnington. No satisfactory solution of what the Council intended to do with the estate has yet been arrived at, but now a rumour has gone forth that the Estate Committee of the Corporation will draw up a scheme in which they purpose transferring the Wavertree Botanical Gardens to Calderstone, with a view to making it also into a grand public park, the residents being thoroughly in accord, providing houses of a certain rateable value are erected. If this idea is carried out there can be no question as to the suitability of such a position, for almost every kind of outdoor plant flourishes most luxuriantly, so pure is the air and rich the soil. Of the present Wavertree Gardens, and the care and attention bestowed upon them since Mr. J. Guttridge took charge, an admiring public—which at any time can be seen wending their way through—are the best judges; and if botanical research cannot be carried out to perfection, there are many other subjects which are equally interesting to the large residential population in the immediate neighbourhood. So rapid are the building operations in every direction, that now or never is the time for a bold policy. By acquiring land every class of the public will be benefited in years to come, and the work of the committee, which is arduous, and sometimes severely criticised, will redound to their credit. The scheme is sure to be followed with much interest.—R. P. R.

## Societies.

### R.H.S. Scientific Committee, December 9th.

Present: Dr. M. T. Masters, in the chair; Messrs. Douglas, Gordon, Hudson, Veitch, Saunders, Bowles, and Worsdell, Dr. Cooke, Revs. W. Wilks and G. Henslow (Hon. Sec.).

*Dr. M. C. Cooke, V.M.H.*—Dr. Masters rose and said he had much pleasure, in which he was quite sure the Committee would join, in handing the gold medal to Dr. Cooke, to whom the Council of the Society had assigned it. Dr. Cooke expressed his thanks for the same.

*Carnation leaves rocting.*—Mr. Douglas observed, with regard to a remark of Mr. Massee's, that roots sometimes occur on the leaves when the roots were affected. That in the case of these he had exhibited the roots were perfectly sound, and he could suggest no cause for the appearance of the roots on the leaves.

*Nephrolepis tuberosa.*—Mr. Saunders exhibited some of the tubers found on the roots of this plant. They did not appear to have "eyes" or buds upon them, so as to be propagative. It was suggested that their use may be for water storage only.

*Celeriac disease.*—Specimens were sent by Mr. Kitson, The Chantry, Netherbury. Dr. Cooke undertook to examine and report upon them.

*Hyacinth bulbs diseased.*—Mr. Saunders gave the following report upon the bulbs sent to the last meeting:—

"A Hyacinth bulb, which was very much decayed, was shown at the last meeting of the R.H.S. Scientific Committee. The bulb contained any number of the bulb mite, *Rhizoglyphus echinopus*, and these mites were no doubt the cause of the injury to the bulb. Besides the mites there was a quantity of a greenish mould, which I imagine only began to grow on the bulb after it had been killed by the mites. When bulbs are infested with these mites in the manner that this one was, nothing can be done, as far as I know, to save them. When only a few mites are at the base of the bulb—where the attack generally commences—they may be killed by immersing the bulbs for five minutes in water at a temperature of 115 or 120deg. Fahr. If some sulphide of potassium (6oz. to a pint) was added to the water, this remedy would be all the more efficacious; indeed it is said that soaking the bulbs in this solution cold for twenty minutes will kill the mites. It is very essential that any of the soil from pots which has contained bulbs infested by this pest should not be allowed to get mixed with fresh soil on the potting bench or elsewhere." Dr. M. C. Cooke added the following observations:—"Such a profuse crop of saprophytic moulds, as *Penicillium*, that they effectually mask the disease, whatever it may be, and there are plentiful *Acari* present." [For figure, with life-history and preventives of the bulb mite, see the *Journal of Horticulture* for September 18, 1902.]

*Dictamnus Fraxinella.*—Mr. Bowles referred to the germination of the seeds of this plant, as they were sown as soon as ripe, but did not germinate. Mr. Wilks observed that the seeds will not germinate if kept any time out of the ground, so that it was thought they may have been overwatered. Mr. Wilks added that the best procedure is to sow them at once in a pan with a tile over it touching the earth, till required to be planted out.

*Physiological experiment.*—Mr. Henslow described an experiment he had carried out with two objects in view. The first was to ascertain if darkness had any effect upon the direction of growth of roots. He grew some Mustard on a perforated tin over a glass of water, the latter having black paper pasted all over it, excepting a narrow strip facing the light, which could fall upon the roots in the water. They, however, grew vertically downwards uninfluenced under these conditions by either light or darkness. The second object was to see if water arrested the growth of the primary root, as in a paper on "A Theoretical Origin of Monocotyledons from Aquatic Dicotyledons" (Journ. Linn. Soc., vol. xxix., page 486), he had inferred from the great number of coincidences, both in morphology and anatomy, that such must have been the case. One such agreement was the total arrest of the axial root in all Monocotyledons and also in aquatic Dicotyledons, as *Ranunculus aquatilis*, *Tripa*, *Ceratophyllum*, *Victoria regia*, &c. Such proved to be the case with Mustard. The conical extremity of the tap-root became brown and died, while strong secondary roots with root-hairs arose from the pericycle of the point just above the dead apex. This experimental verification thus corroborated the above induction.

### Fruit and Vegetable Committee.

A meeting of the members of the Fruit and Vegetable Committee was held at Chiswick on the 5th inst. to test the cooked merits of several late or main crop new varieties of Potatoes that were, at the September meeting, when lifted, found to be great croppers, but when cooked proved to be immature. In spite of the inclement weather, eleven members attended—Mr. H. Balderson (chairman), Messrs. O. Thomas, J. Willard, H. J.

Wright, S. Mortimer, W. Bates, G. Kelf, G. Wythes, G. Reynolds, G. T. Miles, and A. Dean. Ten varieties of Potatoes were cooked, all being admirably presented quite hot. Of these only one, *Victoria Improved* (Sharpe), a fine white round, obtained an Award of Merit, the voting being unanimous. For *Alderman* (Sharpe), voting for and against an award were five each way, the tubers proving to be of unequal quality when tasted. *Sprayfield* (Dobbie), votes six against and four for, was similarly defective. The season is to be credited with this difference, some tubers being younger than others. It was resolved that these two, with *Dalmeny Beauty* (Smith), a very heavy cropper, *Favourite* (Dobbie), *Marfield* (Bristowe), and *Lord Roberts* (also a heavy cropper) be grown again next year under, it is hoped, more favourable conditions. The committee desired that a commendation of the way the tubers were cooked and put on the table be entered on the minutes. It was stated on inquiry (reports "The Garden") that the trials conducted for the committee next year would include Potatoes, Peas, and Tomatoes, as usual, and specially comprehensive ones of Vegetable Marrows and dwarf and climbing Kidney Beans, a full representation of all good old and new varieties being desired and invited.

### Reading Gardeners' Association.

At the last fortnightly meeting of the above association Mr. W. Tribbick, of Brook Gardens, Isle of Wight, read a most interesting and practical paper on "The Cultivation of Peaches and Nectarines." The opening portion treated with the origin, history, and most prominent characteristics of the fruits; and this was followed by cultural details under the following headings:—Position, soil, time of planting, disbudding, watering, ventilation, bud dropping, winter work in houses, manures, diseases, and varieties. A good discussion followed, in which Messrs. Hinton, Neve, Woolford, Blake, Powell, Clinch, Stanton, Alexander, Fry, and Bright took part. The exhibits were not numerous, but one was of exceptional interest—viz., a punnet of Red Currants shown by Mr. F. Bright, of Whiteknights Park, picked on the same day from the open. The fruits were in splendid condition, of good size, and equal to those usually gathered in July. Mr. Hinton, of Walmer Gardens, exhibited several vases of single Chrysanthemums.

### Chester Paxton Society.

The annual general meeting of this society was held in the Grosvenor Museum on Saturday, under the presidency of Mr. John Weaver, Christleton. Mr. G. P. Miln, the hon. sec., submitted his annual report, which showed that the society had enjoyed a greater measure of prosperity during the past year than in any other year since it was instituted in 1889. The number of members and subscribers on the society's books now reaches close upon 500, with a credit balance in hand of over £50. Captain MacGillycuddy, Bache Hall, who takes a keen interest in the society, was unanimously elected president for the year, with Mr. N. F. Barnes, Eaton, as chairman of committee, and the following executive:—Messrs. A. Armstrong, J. Clack, Jno. Dutton, A. Ellams, A. E. Goodman, T. Gilbert, J. Jackson, H. G. Little, G. Lyon, S. May, W. Pringle, Jos. Ryder, E. Stubbs, J. D. Siddall, Robert Wakefield, and Jno. Weaver, with R. Newstead as consulting naturalist and G. P. Miln hon. sec. It was decided to hold the next exhibition of fruits and Chrysanthemums in the Town Hall on Wednesday and Thursday, November 11 and 12, 1903.

### Wargrave Gardeners' Association.

On Wednesday, November 19, the members of the above society held a show of Chrysanthemums, fruit, and vegetables in the Woodcliffe Hall, in aid of the Gardeners' Royal Benevolent Institution. Considering that there was only a fortnight's grace given from the time of the proposal to hold a show, it must be a great success for the small number of gardeners in a district like Wargrave to have put up such an exhibit of Chrysanthemums, &c., as was there, and to collect a sum of £11 19s. 6d., which has been sent to the secretary of the above deserving institution. All the more credit is due to the members for the interest they took in it, and there were no prizes whatever given. Those who could bring plants brought them with the sole idea of providing pleasure for the visitors and to assist the cause. I am certain the wish of all was that it might be an annual exhibition. Among the exhibits were four well-arranged groups of Chrysanthemums and foliage plants that would have done justice to any show. From Park Place came an exhibit of forty-eight dishes of Apples and twenty dishes of Pears, all named, with a basket of Oranges, Citrons, and Diospyros Kaki, together with beautifully worked lyre done with *Bougainvillea* flowers and *Cypripedium insigne*; also a basket of autumn foliage and berries, two wire stands of *Heliotrope* and *Tropæolum*. The basket of

new Potatoes, showing the system of growing new Potatoes all the year round, created much interest. Among the cut flowers and vegetables were some fine examples of culture, but space will not allow me to make mention of them. I trust that the editor will find space for this short report, and that other associations might follow suit for this good cause.—I am, &c., J. BOTLEY, December 10, 1902.

### Bristol Gardeners' Association.

The fortnightly meeting of the society was held at St. John's Parish Room, Redland, on Thursday last, Mr. E. Binfield being in the chair. The subject for the evening was "Stove Plants," introduced by Mr. J. T. Curtis, Stoke Bishop. He dealt in his lecture with the flowering section, and proved in his effort that he was equally master of his subject and the possessor of a pleasing platform ability. Dealing in detail with the Allamanda, Bougainvillea, Clerodendron, Ixora, Gardenia, Anthurium, and others, he gave as the result of much experience full instructions for successful culture of all, treating very fully the soils suitable, potting, watering, and insect pests, with suggestions for their eradication. A good discussion followed the lecture, and Mr. Curtis was accorded the hearty thanks of the meeting. Prizes for two foliage plants were awarded to Mr. J. B. Brain (gardener, Mr. Atwell) and Mr. J. Colthurst Godwin (gardener, Mr. McCulloch). Certificates of merit went to Mr. Poole, F.R.H.S. (gardener to Lady Cave), for collection of stove and greenhouse flowers, and Mr. White (gardener to Mr. Gilbert Howes) for *Dendrobium nobile*. It is interesting to know that the library has been successfully started, the duties of librarian being undertaken by Mr. J. T. Curtis.

### National Carnation and Picotee, Southern Section.

The annual meeting of this Society took place at the Horticultural Club on the 13th inst., Mr. E. Colby Sharpin, the chairman of the committee, presiding over a good attendance, which included Messrs. F. A. Wellesley, H. Turner, A. W. Jones (Birmingham), E. Charrington, C. Blick, A. J. Rowberry, C. Phillips (Bracknell), J. Sargent, W. L. Walker (Reading), &c. Mr. Martin R. Smith, the president of the society, was unable to attend, being abroad for the benefit of his health. The annual report stated that the position of the Society is of a thoroughly sound and satisfactory character; and though forty-five members had been lost to the society by death and other causes, forty-seven new members had been obtained, being two to the good. In view of the balance in hand having been reduced in 1901, the prize money offered in 1902 was reduced in a few particulars, with the result that the income had exceeded the expenditure by £6, although a considerably larger sum had been paid for printing, owing to the demand made for copies of the annual report for 1901, which included a paper by Mr. M. R. Smith on manuring Carnations, and this had necessitated a reprint of the paper. The balance-sheet shows that, including the sum of £119 10s. 6d. brought over from last year, the total income for the year was £358 11s.; subscriptions amounted to £229 6s. 6d.; the expenditure included £128 11s. paid in prizes, printing, &c., £58 7s. 5d., leaving a balance in hand of £125 15s. 10d., a statement which was considered very satisfactory.

Mr. Martin R. Smith was re-elected president; the names of Messrs. M. Rowan (who, on account of ill-health, has retired from the committee) and V. Charrington were added to the vice-presidents, and a proportion of the outgoing members of the committee were elected, together with the names of Messrs. A. J. Rowberry and J. J. Sheldon, as new members of that body. The Floral Committee was re-elected, with the exception of Mr. Went, who retires; and new members were added in the persons of Messrs. W. Spencer and E. Charrington, the number being increased to seven. A communication was received from Mr. B. J. W. Grieve to the effect that, having regard to the financial position of the Society, the pruning knife should be applied to the schedule of prizes, and the number of prizes reduced to two only in each class; he also complained of the judging in Division 4, at the last show prizes having been given to dressed flowers which were staged as undressed blooms, and recommended that every encouragement should be given to undressed blooms, especially in the interest of amateur growers who are not skilful dressers, and that the use of cards and collars should be abandoned.

It was agreed that the attention of the judges should be given to the examination of the calyx of undressed flowers, and the following addition to the regulations was adopted: "There must be no manipulation of the calyx; a split calyx will be a disqualification." It was resolved that in classes 10, 24, and 34 the words "Carnations, Selfs, and Fancies" should read "Selfs, Fancies, and Yellow Grounds," Carnations being deleted. It was suggested that application be made to the Royal Horticultural Society for permission to have small supplemental exhibi-

tions of Carnations at the Drill Hall a fortnight before and a fortnight after the annual show, which is fixed for July 21, 1903. A new class is to be added to Division 4, to follow class 39, for three blooms each of six varieties shown in bottles, the wording to be the same as in class 10, and five prizes were allotted, as also the points the blooms would carry. An additional class was framed to follow the preceding, for single blooms of Selfs, any colour, prizes and points being also allotted. The two last prizes in the classes in Division 4 were withdrawn to supply the prize money in the new classes just created. The method of awarding Certificates of Merit to new varieties came in for some sharp criticism, and on the motion of Mr. F. A. Wellesley, seconded by Mr. A. W. Jones, it was resolved that "the granting of Certificates of Merit shall be vested in the Floral Committee. It shall be an instruction to that body that when awarding a Certificate of Merit, the variety shall also be classified. The judging of new varieties to take place after the judges' luncheon." It was understood that application would be made for a table to be set apart at which the Floral Committee would sit, and all new varieties would be brought to the table. No one but the members of the Floral Committee would be permitted to be near the table at the time. It would obviously be of great advantage to the representatives of the gardening Press if the awards to new varieties were made before, and not until after luncheon. The proceedings concluded with a hearty vote of thanks to the chairman for presiding.

### National Chrysanthemum.

The usual monthly meeting of the Executive Committee took place at the Royal Aquarium, Mr. Thomas Bevan in the chair. Among the correspondence submitted was a letter from Mr. W. H. Hawkins, Blackheath, who asked if one or two classes could be provided for amateurs residing in the smoky suburbs in London. The secretary suggested the letter should be referred to the Schedule Revision Sub-Committee, remarking that in the particular classes Mr. Hawkins referred to he, though residing at Blackheath, had to compete with growers in the Isle of Wight, Ashford, Hitchin, &c. The suggestion was approved. The prizes awarded at the December show, amounting to £59 7s. 6d., was announced, and also the medals awarded to miscellaneous exhibits.

An interim financial statement was submitted of a satisfactory character. The secretary announced that the cheques for the payment of the December prize money had been signed at the meeting of the Finance Committee. Acting upon a request made to the president, Sir A. Rollitt, at the annual general meeting in February last, which arose out of a point of order in relation to the voting powers of the delegates from affiliated societies not being members of the N.C.S., certain amendments submitted by the president were considered, and after considerable discussion a resolution was adopted thanking the president for his assistance in revising the rules; but expressive of some concern lest their adoption in the form in which he had submitted them might affect injuriously the support received from affiliated societies, and requesting Sir Albert to inform the committee whether he desires his amendments to be submitted to the annual general meeting as his personal propositions. An audit of the number of blooms exhibited at the November exhibition was submitted by Mr. A. Taylor, which comprised those staged for competition in the classes for cut blooms alone, and the figures were: Japanese, 1,797; incurved, 471; reflexed, 24; large Anemones, 108; Anemone pompons, 12; pompons, 114; singles, 18; in the three last classes bunches were counted as single blooms.

The chairman stated in answer to a question as to a future place of meeting for the society, that the committee appointed to make inquiries were negotiating, and he hoped in a very few days to be able to make a satisfactory announcement. Three ordinary members and one Fellow were elected, and the thanks of the meeting were given to the chairman for presiding. At the sitting of the Floral Committee in the afternoon nothing worthy of notice was submitted in the way of novelties.

### The National Auricula and Primula.

The annual general meeting of members of this society was held at the Horticultural Club, Hotel Windsor, on the 13th inst., there being a fairly good attendance of members, Mr. E. Colby Sharpin, one of the vice-presidents, in the chair. The annual report declared that the exhibition in April last was one of the largest ever held, and the sum of £11 6s. more was paid in prizes than in the previous year, so good was the competition throughout. Eight members had been lost to the society by death and removals, among them one subscription of £5, and ten new members had joined. As the balance in hand is small, a reduction in prize money was recommended, in order that the balance should not be wiped out in the next year. The balance-sheet showed an income of £92 6s., including £21 13s. 6d.

brought over from last year: the expenditure had been £85 19s. 4d., which included £69 12s. prize money awarded, a balance in the hands of the treasurer of £6 6s. 8d. being carried forward. The report and balance-sheet were adopted.

Some reductions of the amount of prizes in several classes was made to the amount of £8 or thereabouts, which appeared to be a wise proceeding in view of the present state of the society's finances. In the course of revising the schedule of prizes it was announced that class 10 for six green-edged Auriculas, in not less than three varieties, and not more than two of one variety, would read grey-edged instead of green.

Some conversation took place as to the pin-eyed character of some of the new varieties of Alpines, and it was reported that on the occasion of the Midland Auricula Show at Birmingham this year a resolution was passed affirming the importance of the judges of Auriculas asserting the old principle that a protruding style should be a disqualification. Class 31 was made to read instead of a basket of Primrose and Polyanthus plants, it should be a collection staged on a table space 4ft by 3ft, the plants in or out of pots. Sir John T. D. Llewelyn, Bart., was re-elected president; the vice-presidents were re-elected also, with the addition of the name of Mr. J. W. Bentley, Stakehill, Manchester; Messrs. T. A. Wellesley, J. Sargent, and S. Mortimer were elected on the committee, and Mr. T. E. Henwood re-elected hon. sec. and treasurer, with many thanks for his valuable services to the society. A vote of thanks was passed to the chairman for presiding.

### Newport (Mon.) Gardeners' Association.

The usual meeting of the above society was held on Wednesday, December 10, when a most interesting and instructive paper on "Insect Pests" was read by Mr. Reeves, head master of Crindan Schools. Mr. Reeves, who is an ardent enthusiast in the study of "creepy crawly" things, dealt chiefly with the woolly aphis, commonly called American blight. He pointed out, however, that it was not, as commonly supposed, imported from America, but exported from this country to America. It is easily distinguished by a woolly appearance on the growths of the Apple tree, causing a cankerous growth, and is most hurtful to the tree. By the winged females, which are seen from July to October, and by the wind, the blight is spread from tree to tree. It also goes to the roots of the trees during winter. This aphis is found all over Europe, not only on Apple trees, but on the young growths of many forest trees. In America the plan is being tried of raising a stock of aphis-resisting Apple trees, as stocks for grafting; the Northern Spy and Majetin are recommended as being suitable for that purpose. For the destruction of the blight 10lb of quassia, to be boiled in fifty gallons of water, to which add 10lb of softsoap. In using add one gallon of water to each gallon of the liquid. The Pear midge was also shortly dealt with. A discussion followed, in which Messrs. Sharratt, Kenward, Basham, Jones, Powell, and others took part. A hearty vote of thanks was accorded Mr. Reeves for his able paper, which was thoroughly enjoyed. Mr. F. S. Daniels presided over a good attendance of members.—J. PEGLER.

### CARTER'S OF FOREST HILL.

Primulas are as much a speciality with this firm at their Forest Hill Nursery in south-east London, as Cinerarias, Calceolarias, and Cyclamens are. They have been cross fertilising, as is necessary if progress is desired, and a number of their novelties are really very promising. Glancing at the already named varieties, in the first place the following are the more remarkable:—Holborn Carmine, Holborn Scarlet, Princess May, and Elaine among the singles. To the writer these were certainly the most pleasing. Elaine is a Fern-leaved variety, with large white flowers. Holborn Blue, Holborn Vermilion, Holborn Rose, Rose Queen, Holborn Carmine, and Holborn Salmon are described by their names. In habit each differs very slightly from its neighbour, the trusses being in all cases erect, handsome, well-formed, and of large size. Amongst the double varieties I fell particularly in love with Vivid, coloured a rich crimson amaranth. The trusses are very large. Aurora has decided pink flowers. Lilac Queen, Snowflake, and Carmine Empress are each first class varieties, the latter being slightly deeper in colour than a variety named Prince of Wales, which is rosy salmon. Snowflake is pure white at first, but becomes bluish-pink as it grows in age. Altogether about 10,000 plants are grown, and mostly in 5in pots. At the time of my visit, in the dull days of February, the operators were actively manipulating the camel's-hair brush to pollinate the flowers. Amongst the novelties, some of which are likely to be offered in commerce at once, are various crosses between such as the following:—Holborn Carmine x Hercules, Hercules x Holborn Blue, Holborn Scarlet x Holborn Vermilion, Holborn Blue with an ordinary blue Primrose, Ruby x Hercules, and others. I need not now describe the results of these crosses, but would add that in most cases the novelties are very fine, and represent new combinations of colour. The flowers have been increased in size and substance. A new variety, named King Edward VII. (Elaine x Bouquet), is a most beautiful sort, with splendid large flowers of a spotless white. The petals are nicely fringed and the foliage is very robust. This is a single flowered Primula, but its companion is here also, bearing the title Princess of Wales (a double), having a white ground speckled with rose. Carter's Brilliant Prize Cinerarias were promising most satisfactorily.

### A Curious Chair.

One of the most wonderful pieces of furniture in the world, a vegetable chair grown from a single seed, is in the possession of a Mr. T. P. Lukens, of Pasadena, California. A gardener in Korea planted a seed of the Gingko tree about twenty-six years ago. It grew into a creeper, which the gardener set about to fashion by ingenious twistings, compressions, and trainings into an arm-chair, much pruning and binding being necessary before his object was accomplished. The chair weighs more than 100lb, and is even harder, sturdier, and more imperishable than oak. It is 5ft 4in high and 25in wide. The bark has been removed, and the surface has taken a rich polish. The Gingko tree was one of the earliest types of vegetation to appear on the globe, extending far back into the cretaceous period.—("Sun.")

### The Brown Beurré Pear.

A variety one can highly commend, not, perhaps, for handsome appearance, but as a richly flavoured, juicy, melting dessert Pear, and though lacking, in our experience, in sugariness, it is, nevertheless, a fine eating fruit. Our illustration depicts the appearance of a typical fruit, looked at from the side. The Pear is generally about 3in. long by 2½in. broad. The skin is tough and moderately thick, not smooth, bronzy-brown in colour, and speckled with tiny dots of a lighter colour. The eye is set considerably to one side in a shallow basin. The Pear is firm and solid, a good keeper, and good traveller. To grow it well, it requires a wall, bearing freely as a cordon.—ED.

Brown Beurré does not rank among the higher favoured exhibition sorts, though all the same a most dependable Pear. Its name implies its skin colour; its size is medium, its cropping qualities most regular as an open air tree, and quality distinctly commendable. These are all-round attributes that cannot be attached to every good Pear. It is said to be a very old variety, and is certainly one deserving of better acquaintance. It is distinguishable in the greenness of the flesh immediately beneath the skin.—W. S.

The Brown Beurré Pear.

### Fruit Forcing.

**VINES: EARLIEST FORCED IN POTS.**—Where fermenting materials are employed in the pits, and the pots are placed on pillars, frequent additions of fresh leaves or sweetened material should be made as the heat declines. The heat about the pots must not exceed 70deg to 75deg; indeed, that temperature at the base of the pots is sufficient until the buds commence swelling, when the heat may gradually be increased at the roots by placing material about the pots, so as to have it between the degrees named by the time the Vines are coming into leaf. Increase the temperature of the house gradually after the buds are on the move from 55deg, so as to have it 60deg to 65deg by the time the shoots commence developing, allowing an advance to 70deg or 75deg by day, carefully admitting a little air at 70deg, and close early. Disbud as soon as the shows for fruit can be detected in the points of the shoots, reserving the most promising. Stop about two joints beyond the bunches, and pinch the laterals from the current growths at the first leaf, or remove them up to the bunches, allowing those beyond to extend as space permits; but this is usually limited in the case of Vines in pots, therefore retain no more foliage than can have full exposure to light, for to encourage more and afterwards remove it is disastrous.

Moderate moisture only will need to be applied by sprinkling where fermenting materials are employed, and where these are not at command an occasional damping with dilute liquid manure, such as guano, 1oz to a gallon of water, will be of service, while evaporation troughs should be kept charged with it at half-strength. This will give a perceptible smell of ammonia, as well as moisture, constantly, and modify the dry heat where it is solely derived from hot-water pipes. Water should be given carefully at the roots, as these do not move much until the Vines are in growth, and even then they do not require much water before the leaves are formed, and evaporation from them is considerable.

**EARLY FORCED PLANTED-OUT VINES.**—The buds of Vines started last month, even those subjected to no fire heat over 50deg and forced in previous years, are now swelling the buds, and a moist but not very wet condition at the roots. Making the soil sodden by needless waterings is very injurious, retarding instead of accelerating root formation. Raise the temperature gradually, say 2deg or 3deg in the course of a few days, so as to have it 60deg to 65deg at night, when the Vines come into leaf, and 70deg to 75deg in the daytime, with a little air at 70deg without lowering the heat, if only for a short time, so as to secure a change of air once at least in twenty-four hours. If the Vines have not been started early before, and are tardy in moving, ripe fruit being required by a given time, growth may be induced by a brisk moist heat of 70deg to 75deg in the daytime, it being important whilst the foliage is being made that a moderate temperature be employed in order to secure short-jointed wood and stout, well-developed foliage. Young Vines that have not been forced before will need more time, and all young canes must be brought down to a horizontal position, or lower, to insure their breaking the buds regularly. Some well-fermented short stable manure and leaves, placed in ridges on the inside border, will afford a genial moisture and warmth, and lessen the necessity for syringing, it being a bad plan to keep the rods dripping with water, which greatly accelerates aerial roots in pushing and developing.

**MIDSEASON HOUSES.**—Push forward the pruning of the Vines as they become cleared of the Grapes, for there is nothing like a long and complete rest for the Vines, which early pruning in a great measure secures. The Vines ought to be dressed, removing the loose bark, for it does nothing but harbour vermin, yet not going to the opposite extreme of peeling and scraping into the quick or live bark. Wash the rods with an insecticide properly diluted, such as petroleum emulsion, 4oz to a gallon of water, adding  $\frac{1}{2}$ oz sulphide of potassium, previously dissolved in a quart of hot water, to the paraffin emulsion solution, stirring well. Such, rightly administered with a stiffish brush, and every angle, crevice, and hole reached into thoroughly, taking care not to damage the buds, acts both as an insecticide and fungicide. The house also should be thoroughly cleansed, for it is essential that nothing be left undone which in the coming season is of consequence to the health of the Vines. All insects or eggs now cleared away mean the prevention of new colonies in the coming year on the Vines, from which they derive their subsistence, and it is far better to prevent than have to cure

diseases. The loose inert soil should be removed and fresh loam supplied, with an admixture of about one-fourth of well-decayed manure, a sprinkling of charcoal and old mortar rubbish being incorporated with the manure and loam, then a good handful per square yard of the advertised fertilisers sprinkled on the top will put food into the soil ready for the Vine roots to lay hold of in the next season of growth. Liquid manure may be usefully given where the soil is dry or even moist, provided always that the soil is not made dry or sodden. Keep the house cool and dry until the time arrives for starting. If they must be used for plants, keep the temperature at 40deg to 45deg by artificial means. More heat interferes with the resting of the Vines, and in a mean temperature of 50deg they start into growth.

**LATE GRAPES.**—The bunches should be examined at least twice a week for decayed berries, and the house kept cool and dry as consistent with the safety and preservation of the fruit. With the Grapes thoroughly finished, and the Vines leafless, a temperature of 50deg is suitable until the time arrives for bottling; any degree much below that is likely to cause mould and decay, and fire heat, especially at night, will undoubtedly cause the berries to shrivel immediately after the fall of the foliage. Some Grapes improve in quality after this is given, such as Gros Colman, which requires the most time on the Vines, while some soon pass into a red colour and shrivelled condition, especially Mrs. Pince, after the leaves are gone. No further time should be lost in getting the Grape room ready for the stock of keeping Grapes, which, as a rule, would be cleared off the Vines not later than the first week in January, expelling damp from it by the needful firing and ventilation. The Grapes keep better in a suitable room than on the Vines exposed to light, and they lose very little more weight cut than hanging, whilst the losses from decay are reduced to a minimum. Bottling affords relief to the Vines, insuring that perfect rest so essential to their well-being. It also admits of the Vines being started earlier in the spring, and this gives the kinds that require a long time of growth the full benefit of the summer's sun—its light and its warmth—where utilised by early closing, so that the Grapes may be ripened perfectly before the month of September is out.—ST. ALBANS.

### Kitchen Garden.

**POTATOES IN POTS.**—Early Potatoes may be successfully grown in 10in pots in a light, moderately heated structure. Drain the pots, and three parts fill with a compost consisting of old manure, loam, and leaf soil. Plant medium-sized, whole sets with the crown eye upwards, placing three sets in each 10in pot. The number of pots must be regulated by the space at command when growth is taking place, as light and air must be freely given at that period. Early Ashleaf, Ringleader, and Duke of York are varieties suitable for pot culture. The space left in the pots may be filled up with good soil when the growth is large enough.

**PREPARING POTATOES FOR FRAMES.**—Much larger quantities of early Potatoes may be grown in frames than in pots. These may be planted shortly; but in the meantime it is an excellent plan to prepare the sets by encouraging them to make early growth in gentle warmth and moisture. In order to do this place the tubers on end in shallow boxes, which stand in a light, warm position near the glass. With frequent sprinkling the eyes will soon push. As soon as they do, rub off all but the crown eye, which will be the largest and strongest. Under the influence of light it will grow strong and take on a deep purple colour, though more pronounced later in the season than at this early date. Medium-sized tubers are the best.

**TRENCHING GROUND.**—Vacant plots in the kitchen garden should be trenched deeply, especially where crops of Peas, Beans, and root crops are to be grown, and the land is either of a stiff, or a light, poor character. When stiff and difficult to work, trenching improves it, because the loosening of the upper layers allows of the weather acting upon it and pulverising it. The breaking up of the lower spit, which should always be done in trenching, permits of superfluous water draining away, while retaining sufficient for the needs of crops. Light and poor soil is improved, because trenching deepens the medium in which the roots of crops can work. The breaking up and intermixing with enriching materials also tend to permanent improvement, and what is of great importance, a more regular condition of moisture is ensured. A main principle to be kept in view in trenching is not to bring inert subsoil to the surface, and bury the upper layers, which are always the best. Trenching without manuring is beneficial, but the opportunity may be taken, when preparing the land for anything of a gross feeding character, to incorporate a liberal dressing of manure. Tap-rooted vegetables should, however, have the manure placed low down.

**LETTUCE AND ENDIVE.**—When the weather is open about this time the hoe may be run between the plants to lighten up the soil and prevent the rooting of seedling weeds. Plants in frames must receive plenty of air, decaying leaves being

picked off, which will prevent damping. During severe frosts it is best to protect.

**SPINACH.**—The winter Spinach is greatly freshened up and assisted by loosening the surface between the rows when the soil is dry. If the plants have grown well in the autumn, some of the largest leaves may be gathered for use in moderation, but the central leaves should not be touched. Any too-crowded plants may be pulled out.

**PEA AND BEAN STICKS.**—The opportunity should be taken of securing suitable branches from Beech, Oak, and Sycamore trees. Trim and point ready for use when other work cannot be done. After preparing Pea sticks, lay them flat on one another, and weigh down with logs to keep them flat.

**BURNING RUBBISH.**—The accumulations of rubbish in the garden should be placed together in a heap and burnt. When a good fire has been obtained, much of the wet and smaller rubbish, leaves, and weeds may be placed on it, which will cause the burning to be slower, and more in the nature of a smother. The material obtained is valuable to spread on the land.—E. D. S.

\* \* All correspondence relating to editorial matters should be directed to "THE EDITOR," 12, Mitre Court Chambers, Fleet Street, London, E.C. It is requested that no one will write privately to any of our correspondents, seeking information on matters discussed in this Journal, as doing so subjects them to unjustifiable trouble and expense.

**STREPTOSOLEN JAMESONI**, PLANTING (A. M., North Notts).—This very handsome greenhouse evergreen, scabrous-pubescent shrub would not succeed planted outside, and the growths introduced through the wall for training up the roof of a greenhouse similar to Vines, though it certainly is best planted out in a border; but this should be inside the house, being well drained, and a sandy, fibrous, loamy soil provided. A small plant may be accommodated in a pot, but when the plant becomes large it requires a tub, though it is better given a light, airy position, and planted out in a properly prepared border.

**ORCHID PESTS** (J. L., Leeds).—We found no insects in the box, though we examined the contents very carefully with a powerful lens. Either they must have escaped, though this seems impracticable, or been of so small and fragile a nature as to have been withered up. The decayed *Cattleya pseudo-bulb* points to attack and destruction by *Cattleya fly*, *Isosoma*, grub, or maggot, it entering the substance of and destroying the young growth. We do not know of any preventive, and the only remedy is to search for and destroy the grubs, an affected pseudo-bulb indicating it by the stunted and sickly appearance, with softness to the touch when gently felt between the thumb and finger.

**VINES FOR MIDSUMMER** (Oxon).—The selection of varieties you have made, or rather, ask our opinion of, cannot be surpassed for ripening at the end of June, namely Black Hamburgh, which of all Grapes is the best for general use, especially early and midseason, Foster's Seedling, an early and excellent Grape, and will hang for some time after being ripe in good condition, and Madresfield Court, which, when true, has large bunches and berries, oblong or oval, and of the greatest merit. Buckland Sweetwater is also an excellent early Grape. For early forcing, the Vines are best confined to an inside border, or at least until this is thoroughly occupied with roots; then they may be allowed to extend in the outside border, which should not be made until required, the apertures in the front wall to allow the roots to pass into the outside border being walled up until that time. We don't understand what you mean by pruning and planting the Vines at the end of May. If you mean not procuring the Vines until that time, and canes of the current year's raising, we say decidedly don't, for they will receive a check in transporting from the nursery, and not do well. Better procure the canes now, cut them down to within a couple of buds of the base, keep in a cool house and on the dry side, but not so dry at the roots as to cause shrinkage of the wood, and when the buds show signs of swelling, as they will in a cool house in March or April, turn out of the pots, remove the old soil, soaking if necessary, and plant, spreading the roots out evenly, and keeping the collar rather high, not covering the roots more than 3in. With a minimum temperature of 50deg the Vines will start into growth vigorously.

**VACANCIES AT KEW** (C. B.).—Your letter has been privately answered.

**SCALE ON FRUIT TREES** (Inquirer).—Your trees are infested with oyster scale, and they cannot flourish until it is destroyed. Dissolve 4oz of Gishurst compound or nicotine soap in a gallon of hot water, stirring well into it while hot a wine-glassful of petroleum, and apply carefully with a brush, rubbing well into all the crevices. If the mixture is hotter than your hand can be borne in it when applied, it will be more effectual. Trees that are in such a state as yours appear to be must have had their growth much checked, and this would act prejudicially on the roots. We should therefore remove some of the strong soil from them and add fresh, with much gritty matter, such as wood ashes, mixed with it, and mulch with partially decayed manure. It is a pity you did not act sooner, as we fear you will now have some difficulty in re-invigorating the trees.

**MOSS ON FRUIT TREES** (T. S.).—We have quite cleared moss from fruit trees by limewashing the trunks and main branches, and dusting freshly slaked lime liberally amongst the smaller branches and spurs when quite wet after a foggy or drizzling day. If there is no wind a man with the aid of a ladder may dress a good-sized tree in ten minutes, so that every side of every twig is reached, and the lime falling to the ground can be pointed in if needed, and will be beneficial to the roots. The lime should be obtained in lumps, then slaked into powder and used immediately. Having found this quite effectual we have not tried petroleum for the same purpose. If you consider lime unsightly, not only the Mosses and Lichens which so generally affect fruit trees, but the eggs of insects, may be effectually destroyed by dressing the trees in winter with a wash composed of a saturated solution of softsoap and common salt or brine. The trunks and large branches ought to be first scraped with a scraper made of old hoop or any other implement that may be improvised for the purpose, and when all the scales of bark are removed apply the mixture with a painter's brush, working it well into the crevices.

**FORCING SEAKALE** (J. E. B.).—Seakale may be forced in any place where it can be kept moist and dark in a temperature from about 50deg to 70deg. The milder the heat is the slower is the growth, and also the stronger; but the crowns must be in total darkness or the produce will be green, while if the roots and air be dry it will be tough. You may pack the roots closely together in pots, plunge these in a bed of manure and leaves, inverting other pots over the crowns; or you may pack a number of roots in a mixed fermenting bed and box the whole in with boards a foot or 18in above the crowns. In a quite dark place nothing of the kind for excluding light will be required; all that is needed in such a case is a humid atmosphere, gentle warmth, and regular moisture at the roots. Roots established in the ground, covered with pots, these covered to the depth of a foot or so with manure or leaves, will afford excellent Seakale. The thickness of the covering must be regulated by the heat. A stick forced into the mass to remain there, drawn out occasionally and grasped in the hands, will sufficiently indicate the temperature. If neither hot nor cold, but comfortably warm, it will be right for the growth of the crop. A certain number of crowns should be placed in heat or covered about every ten days to maintain a regular supply.

### Meteorological Observations at Chiswick.

## TRADE NOTE.

Mr. Thomas Lewis, who has for many years past been connected with Messrs. W. Clibran and Son, of Altrincham, has resigned his position with that firm, and has been appointed to represent Messrs. John Waterer and Sons, Limited, The American Nursery, Bagshot, Surrey. Mr. Lewis' address will still be Fair Oak House, Routh Park, Cardiff.

## Christmas Foreshadowings.

Christmas comes but once a year;  
When it comes, it brings good cheer.

It is all very well arranging for festivals and times of rejoicing, but what if they do not come off? We need only look back six months and recall a time when our oxen and fatlings were killed, our tables spread, our flags hoisted, and we ourselves ready for the festal garment; but our feast did not come off. Our fatlings had been killed in vain. We dreaded and feared that our flags would have to fly half-mast high, and we feared to speak of the black garment that might be needed instead of the purple and fine linen. We approach our Christmas festival with cheerful hearts; we may add, thankful ones too. But it was about the festival. For how many centuries has this feast come and gone unaffected by time and change? Kingdoms have waxed and waned; principalities and powers have known alike glory and decay; and yet, year after year, on December 25 we lay aside our cares and rejoice that once more we are permitted to again greet with acclamation "The New Born King."

We know some folk consider we make this festival too sensual; there is too much talk of eating and drinking, and that the feasting often leads to gluttony and excess. No prince was ever yet born heir to an earthly throne but it seemed fit and right that high festival should be held, and if we, as a Christian nation, would remember to ask to our feast those for whom nothing is provided, we cannot see who should cavil. But we cannot feast with "the materials," and the materials have been amaking for long. They cannot be tossed up in a moment like an omelet or pancake, and industrious folk have been quietly preparing for the feast of 1902 for a long time back. What are the materials that come first? No Englishman need ask that question—'tis "the roast beef of old England"; but hark ye, friends, a whisper in your ear—is it not rather the roast beef of Scotland? We will not run down our own, but what about Aberdeen Angus? (We have something to say of this later.) Who are the great beef growers—the men who supply the Christmas market? They are not confined to one class, but come under three headings: the King (God bless him!), lords, and commoners. Yes, we are an agricultural people, and on the common ground of the show-yard we are all equal, and the man with but few acres may hold his own even with majesty.

Some of us like beef; others prefer the short-grained, juicy mutton. Mutton, perhaps, has more votaries than beef, it is so eminently suitable to the weakly digestion. The immature growth makes such nice small acceptable joints, and it is dear to the housekeeper inasmuch that the original joint may appear and reappear in so many different guises. Weight for weight, we think mutton to the man of small means is the most economical.

This is nowadays. It was not always so. We can remember the mutton of our youth—tremendously big, and oh! so horribly fat tallow! Even on a leg there were pieces that would sicken a pig, and then mutton, whatever its price, was an extravagant dish. But the fat, coarse mutton no longer exists. Such is the power of man, and such his skill in breeding, that we get well-proportioned joints, with a modicum of fat and the lean so cunningly interspersed with fat globules as to be deliciously moist and pleasant. We think every year sees an improvement in mutton.

We are sure we shall carry all with us when we say Christmas without pig would be but a sorry Christmas. There are those, and many of them, who cannot afford much of the beef and mutton which go to make the Christmas feast; but in the villages there are few who do not kill a pig at this festive season—indeed, it is often pig galore. He does make plenty in the house; every part of him is available, and we can eat him be he ever so fat. Pig is pig this year, dearer than we have known him for long; but, cheap or dear, he plays a prominent part in the bill of fare. What of all the other luxuries, the turkeys, the geese, ducks, and fowls? They are just putting on their last layer of flesh, and there will be busy times for the housewives. Naturally poultry is better to sell dressed than in the feathers, but the work of dressing and trussing is no small one when days are short and the light fails. Town folk have little idea of the time and thought and money that has been spent as they pass through the brilliant markets and make their choice from the good things spread out before them.

The best cheeses, too, are kept for Christmas. It used to be the fashion, and may be yet (though we think it is on the decline) of presenting friends with a ripe Stilton or good piece of Cheddar or Cheshire. Wensleydale is a cheese that has come much to the fore, and uncommonly good it is; but, like all other good cheeses, it must be allowed to mature.

We will go back to our beef and its producers. Fat cattle shows abound, but naturally Smithfield is the most important, though Birmingham, with its Bingley Hall, runs it very close. Norwich, we believe, in point of date comes first, then Birmingham, then London. It is simply marvellous to an outsider the amount of money, the value of the cups and plates which are given at each and all of these exhibitions. They fulfil their aim, however, and we find brought together the best possible stock in the world. We said His Majesty is an exhibitor. Yes, at Smithfield during last week he was represented by no less than twenty-five head of stock from his farms at Windsor and Sandringham. Talk of Farmer George—it is Farmer Edward. And again there is a Royal George there. The Prince is following in his father's steps, and secured a second with his red polled steer. We shall see him as a cup winner yet.

What exactly has His Majesty done at Smithfield? For Hereford steers, not exceeding two years old, he takes a first; also the breed cup and the cup for the best beast not exceeding two years old. For the steer not exceeding three years old, first; for shorthorn steers, first; for shorthorn heifers, not older than three years, first; breed cup, and reserve cup for best heifer; Highland breed: Highland steer, not exceeding three years, first, and a second for an older steer; then again a second and a third. A good record, we think.

The champion plate, the King's challenge cup, the cup for the best heifer, and the breed cup all go to Lord Strathmore and Kinghorne of Glamis, and the beautiful heifer which wins him all this is Layia of Glamis, an Aberdeen Angus. She thus repeats her Birmingham victory. There she won for her fortunate owner silver cup for best animal, Messrs. Elkington's challenge cup, Joseph Thorley's challenge cup, Messrs. Webb's ditto, and also Messrs. Tipper and Sons' challenge prize, and the Maismore Park challenge cup—five cups and a prize at Birmingham, and in London her class and breed prize, champion plate, and two cups. These cross-bred beasts are bad to beat. They take so kindly to forcing, and come to the ring and afterwards to the block in such beautiful condition. No boiling pieces about them.

For sheep the Leicester prizes go, as usual, to Ernest Jordan, Driffild. We wonder how many prizes he and his late father secured with this breed? For Lincolns, Henry Dudding is to the fore, and he wrests from Mr. Jordan the challenge plate (£50) for long wools. One man did not live to see his triumphs with Southdowns. Colonel McCalmont, whose sudden death on Monday will be much deplored, took a breed cup and some first, second, and third prizes. The best pig man at Birmingham, Mr. A. Brown, was also to the fore at Smithfield.

In the Barley competition we wish date of sowing had been given. We generally notice that it is the earliest sown Barley that comes out best in quality. To say the root exhibits were like wax models is perhaps to disparage them. What we mean is that they are so perfect in symmetry and

shape as to give the idea of being all cast in one mould (that is, the different varieties).

While on the subject of roots we were much struck by an account of Turnip growing extraordinary, in the "North British Agriculturist" of November 26. The Stirling Agricultural Society offer prizes for roots open to the counties of Stirling, Dumbarton, Clackmannan, Kinross, and the Western districts of Perth and Fife. The entries were seventy-five. In these competitions Captain Stirling carried off five first prizes out of six, the only first that escaped him being for crops grown on carse land, of which he had none. The winning crop of Swedes weighed 37 tons 15½ cwt., while the yellows weighed 39½ tons 3½ cwt. Who says Turnip growing is a failure? Well, the gallant Captain deserved a good crop, for he did not neglect to feed his land: 25 tons per acre of farmyard manure, 1 ton ground lime, 2 cwt superphosphate, 2 cwt dissolved bones, 1 cwt bone-meal, and a dressing of sulphate of ammonia, quantity not given. We wonder how the Barley will stand next year? There ought to be a bumper crop.

### Work on the Home Farm.

Swede Turnips are still as they were. The rain had no sooner cleared up than frost set in, accompanied by slight snow. The frost was not severe enough to injure the roots we hope, but it has spent a week, and we are very near Christmas. Though it is milder to-day there is a little bone left in the top soil, and we cannot begin on the Swedes until to-morrow. That labour is not very plentiful is evidenced by a neighbour having to advertise for men to pull Swedes. Now the Irishmen have nearly all gone local men will find ample employment.

As we had no manure ready to cart out, we employed the frosty days in covering a big heap of Potato haulm with soil. Some people burn Potato tops, and it is an easy way to get rid of them, but, if a spare corner can be found, they make excellent compost in a year or two. The space beneath the shadow of a large hedgerow tree may be used for this purpose. To get the haulm to decompose quickly a covering of soil is necessary. If the heap is turned over after twelve months it will be ready for use the following year.

An objection to making manure of Potato tops is the fear that by so doing we may be storing up the germs of disease, and we certainly think it unwise to use for a Potato crop manure which has in it any Potato residue; but to carry out that idea to the full we must not use for Potatoes the manure from a yard where pigs have been fed with raw diseased Potatoes, but that is constantly done, and especially on small farms, where the pig is such an important animal. The soil we cover the haulm with we get from the side of a bye-road. We ploughed five or six furrows from each side, and there will be occupation for more frost-bound days later on. There is a similarly made heap ready to use, but we shall keep it for a really severe time and put it on grass.

Sheep were very comfortable on roots during the frost; we fear the lair will be bad after the thaw. Turnips are a prodigious crop. At our Christmas fat-stock auction the supply of mutton will be very small in spite of all the auctioneer's efforts. There will be a good supply of cattle and probably a good trade. Small pigs have been plentiful and fairly cheap, but fat pigs are being killed freely, and small ones are wanted to occupy the sties, so prices are rising again. If all breeders were as fortunate as a small occupier in this place the pig market would soon be glutted. His sow (second litter) has fourteen pigs, and all doing well.

Bacon pigs are said to be somewhat disappointing when they are put on the weighing-scale. Well! good meal makes good bacon, but damp, badly-got corn, which cannot be sold, is very dear stuff to feed pigs with, and there is too much of such rubbish being used just now.

We have received for review copies of the Doggie Wall Calendar for 1903, issued by Spratt's Patent, Limited, 24 and 25, Fenchurch Street, London, E.C. We notice that there are eight portraits of prize dogs, comprising pointer, Scottish terrier, bulldog, toy Pomeranian, Airedale, retriever, Great Dane, and fox terrier. They are all reproduced by half-tone blocks on art paper. At the back of each picture is given detailed technical information as to the points of breed depicted. There are also illustrations of prize turkeys and of cage birds by Mr. Lydon. The firm have introduced a new feature this year, by means of which each month, as dispensed with, need not be torn off, but can be kept for reference at back. To those of our readers who make early application Spratt's Patent, Limited, will be pleased to send a copy on receipt of penny stamp for postage addressed to Almanack Department, Spratt's Patent, Limited, 24, Fenchurch Street, London.

## CARNATIONS, PICOTEEES, and PINKS.

CATALOGUE of all the Best for Exhibition or Border, post free.

CARNATIONS, 5/-, 6/-, and 7/6 per dozen; LACED PINKS, 3/6 per dozen, mv selection; CARNATION SEED, 1/6 and 2/6 per packet; Choice ALPINE AURICULA SEED, 1/6 and 2/6 per packet. All free for Cash.

IS CORDIALLY INVITED BY

**HUGH LOW & CO.,** BUSH HILL PARK, MIDDLESEX.

## PEED'S "GOLD MEDAL" BEGONIAS

We have harvested the finest lot of Seed this year that we have ever managed to secure.

Single, mixed, per packet, 2/6 and 5/-.

Single, in the following colours, Plnk, Scarlet, Crimson, Yellow, White, Salmon, each, 2/6 per packet.

The Collection of six colours, 12/6.

Extra choice double mixed, 2/6 and 5/-.

**JOHN PEED & SON, WEST NORWOOD, S.E.**

Great Private Sale.—Removing.—Estate Sold.

In Quantities and Selection to suit Buyers.

## FRUIT TREES.

40,000 VERY CHOICEST KINDS.

(Standard, Pyramids, and Wall-trained) Apples, Pears, Cherries, Peaches, Plums, and Damsons. 190 kinds.

An opportunity like this has never occurred for intending planters to secure such splendidly grown, transplanted, carefully pruned fruiting trees. No starvelings or old stunted rubbish, but cultivated for tenants. See Catalogue for doz. or 1000, how and what kinds to grow. The trees average 5 years old and just ready for removal. Thousands Currants, Gooseberry, Raspberry and Strawberry, Shrubs, Roses, and Rhododendrons. All young and guaranteed true to name. 10,000 Filberts, 5ft. high, very bushy and been transplanted.

4000 Magnificent Standard Damsons, King of Damsons.

**J. P. JONES, Churchfield Estate, CRADLEY, near MALVERN.**

Price 2/6; Post Free 2/7½.

## SPECIAL OFFER.

## CLIBRANS TUBEROUS BEGONIAS

Our Tuberous Begonias are renowned for their strength and vigour, their upright habit, and the rich and varied colouring of their flowers. We have a grand stock of Dry Tubers on hand, and offer—SINGLE, choice mixed, 3/- per doz., 20/- per 100; DOUBLE, choice mixed, 6/- and 9/- per doz.; to colour, 12/-, 18/-, 24/-, and 30/- per doz.; CRISTATA, the lovely crested form, to colour, 12/-, 18/-, and 24/- per doz.; mixed, 9/- per doz.

## CLIBRANS GOLD MEDAL CALCEOLARIAS

Unequalled for the brilliancy of their large flowers, their dwarf habit, and strong constitution. Extra strong plants, in 3-in. pots, 3/- and 4/- per doz.; in 5-in. pots, 6/- and 9/- per doz.

## CLIBRANS "PRIZE" CINERARIAS

A superb strain of the strong petalled, large-flowered type, beautiful and diverse in their colouring, excellent habit. Strong plants, in 5-in. pots, 9/- per doz.

**COLEUS THYRSOIDEUS.**—Dwarf, strong, healthy plants of this lovely blue-flowered species, just showing bloom, 1/- and 1/6 each.

**KALANCHOE FLAMMEA.**—Strong plants, 1/6 to 3/6 each.

Catalogues Gratis and Post Free.

THURSDAY, DECEMBER 25, 1902.

## The Craze Against Size.

It is well known that there was at one time, in all departments of horticulture, fruit, flowers, and vegetables, a craze for size, especially for specimens intended for exhibition, and among vegetables I think this craze is not as much subdued as it should be. In flowers I do not think matters were ever as bad as people tried to make out; the National Rose Society never gave way to it, never commended Paul Neyron, and is at the present time, if anything, rather inclined to undervalue size. As to Chrysanthemums, I will say nothing; personally, I do not like the show varieties, but have not sufficient knowledge of them to make any criticism. In some fruits the craze for size may have led to a neglect of other good qualities, and in many vegetables, as I have said, size, smoothness, and appearance seem still to me to be too much thought of.

It is, of course, a very great mistake to think that because a thing is big, therefore it is good. I remember, some years ago, at the cottagers' show in the next parish, someone offered a prize for "the biggest Potato in the show," which I promptly met by offering a special prize at the show in my parish for "the best Potato." The tuber thus singled out was naturally taken as a pattern, and quality improved immensely in the next few years. There were, of course, a great many others, all over the kingdom, teaching in a practical way the correct doctrine of quality rather than size, even in show competition, and their views gradually prevailed. Unfortunately, there is a state of things known as "the swing of the Pendulum," which generally occurs in all cases of revulsion of feeling from preconceived opinions. The Pendulum, having reached its highest or extreme on one side, falls back, and

READERS are requested to send notices of Gardening Appointments or Notes of Horticultural Interest, intimations of Meetings, Queries, and all Articles for Publication, officially to "THE EDITOR," at 12, Mitre Court Chambers, Fleet Street, London, E.C., and to no other person and to no other address.

will not remain upright true and straight in the middle of the curve, but straightway goes beyond it, higher and further, almost to the opposite extreme. So it is with all social human opinion.

People have now, in some departments of horticulture, begun actually and openly to look upon size as a fault in itself, which, in my humble opinion, is as great an error as the other. According to the views of such people, a horticultural product cannot be good if it is big—above the medium average size. If your soil, situation, or manner of cultivation is such that you cannot get size, it is very easy to pose as one who despises mere bigness and goes in for quality only, leaving it to be implied that size and quality cannot go together. Being personally a man whose stature may be reckoned by yards, I have heard a good deal in my time of such aphorisms as "The best goods are done up in small parcels," &c., and—oh! well, it may be true enough as far as I am concerned, but I demur to it as a universal axiom.

A favourite old Plum was the *Magnum Bonum*; but according to some modern views a fruit cannot be bonum if it is magnum. Perhaps Mr. Bunyard can tell us if the reason why *Roundway Magnum Bonum*, which he asserts to be the best of all dessert Apples, is so seldom grown, seen, or heard of, is simply because it is too big.

I protest against the 3in ring rule for dessert Apples, as put forth by the R.H.S., and now generally adopted. I think it was at first only applied to *Blenheim Orange*, but (if I am not mistaken) at some shows it governs now the whole of the dessert Apple classes. If I asked the reason for it I am told that large Apples are no use for dessert; if carried round no one would take them. But is the Royal Horticultural Society to be influenced and ruled by butlers and footmen? or to guide them in their manner of offering and dealing with the choicest fruits? I never heard of any difficulty in dealing with *Pitmaston Duchess* Pears or large Melons. I suppose there would be no difficulty in cutting the larger Apples, or some of them, once across, or handing round slices, as of Melons, for, to my taste, an Apple is a far better fruit than a Melon.

But it will perhaps be said people will not have the larger Apples for dessert. Well, if they are wrong, as I think they are, they should not be yielded to, but gently educated to see the very obvious reasons why a good big Apple is much better than a good little one. What part of the Apple do you want to eat? The rind and core, or the flesh? I have seen a first-prize collection of six sorts of dessert Apples, wretched little things, some of them, not much bigger than *Siberian Crabs*, where I am sure I could not get a decent mouthful anywhere without having at the same time a lot of core and pips and eye, whether the fruit was peeled or not; whereas, with the half of a good big *Blenheim* or *Ribston* you may get a real good and enjoyable bite of the finest fruit the world produces. For my own part, I think a 2in ring minimum would be much more to the purpose.

Now, if anyone suggests that this letter is a clamour for size at the expense of quality, I would point out at once that it is not so. I only wish to assert that it is possible for a flower or fruit or vegetable to be bonum as well as magnum, and magnum as well as bonum, and that in some fruits there is an especial advantage in size, in that the edible part is more comfortably and conveniently presented, and more free from impediment.—W. R. RAILLEM.

#### The Romans and Soil Fertility.

At the last meeting of the Linnean Society, Dr. George Henderson called attention to a passage in the *Georgics* of Virgil, in which the poet, after recommending a system of fallowing, proposes, as an alternative means of restoring the fertility of the soil, that before taking a second grain crop the soil should be fertilised by planting it with a leguminous crop. The Romans believed that these plants actually enriched the soil, especially if the roots were plentiful. It is remarkable that recent discoveries regarding the nitrification of the soil by the roots of leguminosae should have been foreshadowed so long ago by a people who could have known nothing of chemistry or vegetable physiology.

## Methods of Propagation.

Recently in looking over some of my manuscript papers on horticultural subjects, which were written some years ago when working up for an examination in horticulture, I found one on methods of propagation. This is a very interesting subject, so perhaps a few notes may not be out of place in our Journal, and useful to some of its readers. There are many ways by which plants may be propagated; but, of course, the most natural method is by seeds. The great majority of plants are reproduced in this way, and a great deal might be written on this alone. In these notes, however, it is intended to dwell upon other methods of propagation. At the same time, a few points to be remembered in connection with propagation by means of seed may be alluded to. All plants that bear flowers may be increased by seeds. These should be large of their kind, heavy, plump, and well developed. All seeds contain reserve food material, which is either stored in the embryo plant itself, or surrounding it. To produce a plant from a seed it must be put in the ground to germinate.

The essential points in germination are moisture, warmth, and fresh air. No seed will germinate in a temperature below freezing point; a temperature of about 40deg or 42deg F. is required, although the seeds of many plants will germinate in a lower temperature. Moisture is necessary to soften the tissue, as the food contained in the seed is in an insoluble condition. Water enables the insoluble reserve material to assume a soluble form. Fresh air, or oxygen contained in it, is necessary for the carrying on of these chemical changes. If seeds are buried so deeply that air cannot reach them germination will not take place. When germination commences, and the embryo begins to grow, by using up the soluble food, several changes take place. One of the most important is the changing of starch into dextrin, through the influence of a nitrogenous substance (diastase), which acts as a ferment.

#### Cuttings.

This is an easy way of propagating plants, and of keeping them true to the character of the parent. Different parts of the plant may be used for cuttings. Sometimes the young, growing, leafy shoots are best; in other cases the ripened or partly ripened growths are used. Then there are leaf cuttings and root cuttings. Roots are generally formed at a node or joint, but some plants will also emit roots at any part of the stem. Softwooded cuttings, as a rule, require a warm, moist temperature and a close atmosphere to enable them to root quickly and well. Cuttings made of the ripened shoots will naturally be longer in forming roots. In the case of fruit trees, Conifers, and hardy deciduous trees and shrubs are best inserted in the autumn, August and September being suitable months for Conifers and Roses, while October will be best for such things as Gooseberries, Currants, &c. Cuttings of most hardy plants may be inserted in lines on an open border. It is a good plan to add some sandy soil in the trench, on which the base of the cutting may rest, and the soil should be made very firm round it. I find some plants, such as Tea Roses and Conifers, take root better in pots. They are best stood in a cold frame when inserted; but on the approach of severe weather should be removed to a structure from which frost is excluded. In spring, if introduced to a gentle heat, the process of rooting will be greatly facilitated. Some plants may be increased by leaf cuttings, such as Begonias and Gloxinias. The leaves may be inserted by the petiole, but the base of the leaf must also be in the soil. Another method is to lay the leaves flat on the surface of the soil; before doing so the main ribs of the leaf should be notched at intervals. Roots will be emitted from these notches, and several plants will often be produced from a single leaf. An important point to bear in mind when inserting a cutting is to make sure that the base of it rests firmly on the soil. Inattention to this particular is a frequent cause of many plants being lost.—J. S. UPEX.

(To be continued.)

#### Malmaison Carnations.

Respecting the photograph of *Malmaison Carnations* reproduced on page 565, we incorrectly stated that Mr. G. H. Cook, the sender of the photograph, was head-gardener at Milburn, Esher. Mr. Cook is foreman in the gardens there.

**Cypripedium × William Lloyd.**

This is one of the handsomest *Cypripediums* in cultivation, and stood out prominently in Messrs. J. Cypher's collection at a recent meeting of the Royal Horticultural Society in London. It is a hybrid from *C. bellatulum* and *C. Swonianum*. The upper sepal, like the whole flower, suffused with purple-rose, with darker veins; the petals are heavily blotched.

**Vanda Kimballiana.**

This beautiful species flowers generally in autumn, throwing scapes 12in to 18in long, bearing several flowers apiece. The flowers are nearly, or quite, 2in in diameter, with white sepals and petals, sometimes flushed with pale purple. The lip is three-lobed, the side lobes small, yellow, and spotted with red-brown. The central lobe is of a bright amethyst-purple, the spur light purple, and about 1in long. The species is a native of Burmah, and requires the temperature of an intermediate house.

**The Week's Cultural Notes.**

The *Anæchtochilus*, and several other nearly related genera, are by no means generally cultivated or well done by growers. Yet the culture of many of them is not difficult if a few of the principal details are carefully gone into. I think that more of these lovely plants have been killed by too abundant heat and a close atmosphere than anything else, closely-fitting bell-glasses and handlights not being at all to their taste. Whatever is used to cover them, there should be a constant supply of air coming through, the bellglass or handlight being raised slightly at the bottom and a small hole provided at the top.

This prevents condensed moisture falling upon the beautiful foliage, and, what is equally important, renders the stems hard and firm, capable of withstanding any slight check that may occur even with the best care. At present the plants are taking very little water, the growth being, comparatively speaking, at a stop, but the roots are always slightly active, and a perfectly dry state must be avoided. Watch carefully now for signs of red spider or thrips, and as soon as any are seen have the whole of the plants removed from the cases and well sponged. This can do no harm even if insects are not present, as fumigation is dangerous to them, and sponging may prevent its becoming necessary.

Several of the *Pleiones*, such as *P. lagenaria*, are beginning already to root in the new compost, and must be kept under close observation. Light waterings at first, with a position where abundant light reaches them from all sides, are necessary, increasing the water supply as the roots develop. The later flowering species should have attention immediately the flowers are past, or the new roots will begin to push and be damaged in the repotting process. Not a drop of water should be allowed around

**Vanda Kimballiana.**

the bulbs at first. They have ample substance in them to keep the young shoots going, and the dry compost is best for the new roots when they appear.

The later repotted *Cattleyas*, such as *C. gigas*, *C. aurea*, and even *C. Bowringiana*, are now well established in their new pots, the freedom given to the new tiers of roots having served to

swell up fine new growths. The quieter these are now kept the better, a thorough rest strengthening the plants and tending to

**Cypripedium × William Lloyd.**

vigour in the young growth. Keep *C. Warneri*—the spring flowering *C. labiata*—well up to the glass, and allow sufficient water to prevent the least sign of shrivelling. The same remark applies to the cool house species, *C. citrina*.—H. R. R.

**ROSES NEAR LARGE TOWNS.**

At the monthly dinner of the Horticultural Club, presided over by Mr. Harry Veitch, at the Hotel Windsor, on the 9th inst., Mr. Herbert Molyneux gave a most interesting and instructive paper on "Roses near Large Towns," in which he gave the results of intelligent culture well within the area affected by London smoke. He pointed out that one of the chief causes of the failure which attended so many amateur attempts at Rose growing under similar conditions, and which led to a popular belief that success was impossible, was the fact that in most cases the plants were purchased at auction, which involved generally an unduly prolonged exposure of the roots to the air, and a consequent loss of vitality, which was eventually increased by the injudicious method of dibbling in adopted by the jobbing gardener.

Success could only be obtained by planting Roses freshly acquired from the nursery, and protecting the roots as much as possible prior to their installation in properly prepared stations. This done, with judicious syringing with water, and, when needed, with insecticide infusions, the foliage could be kept in a clean and healthy condition, with the result that an abundance of splendid flowers eventually richly rewarded the extra care involved. A real, and not a merely professed, love of flowers was essential, and if this existed the trouble involved was a pleasure, and, in any case, experience had proved to the lecturer that it was the laziness of the amateur rather than the atmospheric conditions which led to the great bulk of the failures. Messrs. Geo. Paul, jun., H. Veitch, E. T. Cook, J. Hudson, and others discussed the paper fully, and confirmed its conclusions throughout, the last named gentleman's work at Gunnersbury under similar handicapping conditions forming full practical confirmation in itself. A hearty vote of thanks was coupled with a request for a further paper dealing with other points, and this was promised.

# NOTES & NOTICES

## Appointment.

We learn that Mr. William Bygrave, late of Rous Lench Court, Evesham, was appointed in May last as head gardener to H. Stafford O'Brien, Esq., Blatherwyke Park, Wansford, Northamptonshire.

## Royal Horticultural Society.

The first meeting of the committees of the Royal Horticultural Society in 1903 will be held as usual in the Drill Hall, Buckingham Gate, Westminster, on Tuesday, January 13. An election of new Fellows will take place at three o'clock. To prevent misunderstanding, it may be mentioned that the committees of 1902 do not vacate office until the date of the annual meeting, 1903, and in like manner all Fellows' tickets of 1902 are available until the end of January, 1903. At a general meeting of the Royal Horticultural Society held on Tuesday, December 9, fifty-one new Fellows were elected, making a total of 1,140 elected since the beginning of the present year.

## East Anglian Daffodil Show.

The hon. secretaries (Messrs. J. Andrews and A. E. Stubbs) intimate that the scholars of the Middle School for Boys and Endowed School for Girls at Ipswich have, through the kindness of Mr. T. E. Cattell and Miss G. Beatrice Harrison, been able to place amongst the scholars over 1,200 bulbs for competition at the above show, to be held in the Public Hall, Ipswich, on April 22 next. Each competitor has been supplied with five bulbs, instead of three bulbs as last year, and that is owing to the kindness of leading English, Scotch, and Irish bulb growers.

## Some Old Apple Trees.

Seymour Keyser, of Manheim, Herkimer County, N.Y., has two old Apple trees on his farm that are record breakers. One of them is 12ft in circumference. It is a Holland Pippin, and was brought from Holland in the latter part of the seventeenth century. The tree is still bearing fruit. Another tree fell to the ground over half a century ago; the body of the original roots have long been decayed. The top of this tree has taken root, and receives its nourishment from the lower end of the top of the original tree. The Apples are of the Rustycoat variety. This tree was also brought from Holland at the same time as the first mentioned, and is also bearing fruit.—"Country Gentleman."

## Birmingham Gardeners' Association.

At the fortnightly meeting of the members of this society, Mr. J. Udale, chief horticultural instructor for Worcestershire, Droitwich, was responsible for an able lecture entitled, "Hardy flowering shrubs, with relation to landscape gardening." The essayist strongly advocated the massing of flowering and ornamental foliage shrubs of one kind, or species and varieties alone of one colour or a combination of suitable blendings to produce striking pictorial effects, in preference to the indiscriminate or intermixed system of planting, where ample space would allow, such as, for instance, public parks, extensive private pleasure grounds, of the manse, and large villa grounds, also, of course, in a most limited degree in the small villa garden.

## Formation of a British Botanical Association.

For the purpose of promoting a closer study of the science of botany, a company is being formed at York, and it is to be known as the "British Botanical Association." The intention is to take over the educational department established a couple of years ago by Messrs. James Backhouse and Son (Limited), in connection with their York nurseries, and to carry on their investigations on systematic lines. The property to be acquired consists of an acre and a half of land, a suite of laboratories, and a number of greenhouses. The association are to extend their work to practical agriculture and kindred industries by offering facilities for accurate seed testing and the investigation of plant diseases. The scheme offers no speculative attraction. There will be no share capital, the liability of members being limited by guarantee only in addition to a small annual contribution to meet expenses.

## Chrysanthemum, Lord Alverstone.

Mr. Godfrey writes: "An error has crept into my letter, on page 566 of last week. I meant; in respect to Lord Alverstone, that I had some very fine blooms on plants less than 2ft in height, but the three blooms I placed before the R.H.S. Floral Committee were not 'past,' but were 'passed' (by the Committee), so I suppose I over-estimated them."

## Free Speech in Liverpool Parks.

Since the lamentable Kensit affair the Parks and Gardens Committee have been seriously considering the advisability of allowing meetings to be held in the parks, but as yet it does not appear likely to be fulfilled. A bye-law distinctly states that no such meetings shall be allowed, and this the committee do not feel justified in having altered. From various opinions expressed, it seems at present all in favour of the parks being kept as heretofore, viz., a place for quiet recreation, where the public may find rest from the turmoil of the busy city, and be free from any irritating consequences such meetings might probably entail.—R. P. R.

## New Recreation Ground for Seacombe.

Last week there was opened, in connection with the Urban District Council of Wallasey, a central recreation ground, situate in Seacombe. The position is a beautiful one, overlooking the River Mersey. For the space at command, the shrubbery arrangements have been placed to very great advantage, whilst the fact has not been lost sight of that, here, in this populous district, the rising generation must be catered for, suitable provision in the way of swings, &c., having been carefully considered. For the more mature members, bowling greens of large dimensions cannot fail to be of great advantage. Much levelling has been required, the whole reflecting the greatest credit on Mr. Rooking, the parks superintendent, whose work has been well executed.—R. P. R.

## National Dahlia Society: An Appeal.

We have received the following letter addressed to the members of the above society: At the annual meeting of the London Dahlia Union, held on November 4 last, at the Royal Aquarium, the chairman, Mr. John Green, announced his intention of giving a ten-guinea challenge cup, to be competed for in the premier amateur class for Cactus Dahlias at the annual exhibition of the London Dahlia Union, the cup to become the property of the winner if won for three consecutive years. This liberal offer of Mr. Green's places the London Dahlia Union in a position to offer a considerably greater attraction to amateur exhibitors than the National Dahlia Society. Although the supporters of the Dahlia are doubtless united in wishing success equally to both societies, I feel sure that the members of the National Dahlia Society would regret to see this society placed in a position of secondary importance, and I therefore venture to suggest to my fellow members that an endeavour should be made to raise the sum of twenty guineas by subscription, for the purpose of offering two ten-guinea challenge cups, one to be offered in the premier Cactus Dahlia class for nurserymen and the other in the premier Cactus Dahlia class for amateurs, the cups to become the property of the winners if won for three consecutive years. The National Dahlia Society numbers 160 members, and if each member would be willing to subscribe 2s. 6d., a sum of £20 would thus be raised, which I should be happy to increase to twenty guineas, in addition to paying the expenses of the printing and sending out of this appeal, and acknowledging all subscriptions sent to me. Although a member of the committee of the National Dahlia Society, I may say that I am making this appeal simply as a private member of the society to my fellow members. All subscriptions sent to me will be duly acknowledged, and handed over to our hon. treasurer, C. E. Wilkins, Esq., together with a list of the subscribers and the amount of each subscription. Might I venture at the same time to make another appeal; which is that each member of the society should make an effort to introduce at least one new member for 1903? If this could be accomplished, and each new member subscribed no more than 5s., the result would be an important addition to the income of the society, thus enabling better prizes to be offered at the annual exhibition, which could hardly fail to increase the competition and improve the all-round quality of the exhibits.—P. W. TULLOCH, "Sterndale," New Church Road, Hove, Sussex, December 11, 1902.

**The Education Bill.**

We should much esteem the favour of an early intimation in your columns that the St. Bride's Press, Limited—who are the proprietors of "The County Council Times," the official organ of the county councils and of various educational associations—will publish on the first day of the New Year a weekly paper, to be called "Education, Primary, Secondary, and Technical," which will deal mainly with the work of the authorities under the Education Bill.—THE ST. BRIDE'S PRESS, LIMITED.

**Christmas, 1902.**

How hurriedly the weeks, and the months, and the years pass by! And one seems ever to be planning to give the swift recurring events the attention they properly deserve, but one's endeavours often lack completion before the subject of the day is upon us and passing into history. It is so with gardeners, as it is with editors. It is the reply of honest workers that they do their best, and it should be a watchword with everyone. We are now at Christmas, 1902, and, while the period is one of Christian rejoicings, it is also a time at which we all look forward on the work of another year. May this New Year be completed with very happy recollections and satisfaction in the minds of each Journal reader, and at this present, may Christmas be really Christmas to all.

**Luther Burbank of Santa Rosa, Cal.**

Luther Burbank, who may well be given the title of America's most practical hybridist and plant breeder, now of Santa Rosa, Cal., is a native of the East U.S., having been born in Lancaster, Worcester County, Mass., March 7, 1849. Wherever plant improvement is known and studied there Burbank's fame goes also. He seems to be possessed of a genius for breeding plants, and it was a source of universal regret that this great exponent of the art could not arrange to have been present at the International Conference on Plant Breeding and Hybridisation which lately was held in the city of New York. He contributed, however, to the proceedings of the conference a very interesting and suggestive paper, in which he wished to show how the question of plant breeding was as yet merely touched upon by those who were interested in it. The few statistical observations he made are appalling in their significance. To think that one grain per ear of Wheat would add to the yield of the country fifteen million extra bushels, and that one Potato more to each hill would increase the yield by twenty-one million bushels! Luther Burbank was the thirteenth child of the fifteen born to Samuel Walton Burbank, his father, a man widely known in business relations in his native place. Professor Wickson, of the University of California, recently wrote an appreciative series of articles in the "Sunset Magazine." Professor Wickson says that "Luther Burbank is descended from an ancestry of indoor people chiefly active in pedagogical and manufacturing affairs, and disclosing no notable taste for outdoor pursuits." Evidently the characteristic traits of this man have been inherited through his mother's family. His maternal grandfather, Peter Goff Ross, was a grower of seedling Grapes, and other members of the family indulged in horticulture. Of the mother's family, also, were the Burpees, of whom a well-known seedsman of to-day is a present representative. Evidently "Mendel's Law" is illustrated here; the influence of the maternal ancestors was "dominant." To continue quoting: "His start upon life was not strong; he was slight of build, rather serious in manner, and retiring in disposition. At a very early age he began to make playmates of plants, and his doll was a Cactus plant fondly carried about. In school he was a diligent pupil, but was never able to overcome the fear of the sound of his own voice. He was very apt with the pen, and free in composition." As a boy Luther worked in the shops of the Ames Plow Company, and during his half holidays spent his time among his uncle's seedling Grapes and Rhubarbs. At the age of sixteen he developed an improvement in the woodworking machinery of the factory, which led to the concern offering to retain him at more than twenty-five times his then wage if he would work as an inventor; but he decided on a horticultural career. A question of plant improvement was first brought to his notice by a discussion on Potatoes. Becoming convinced that California offered a more suitable climate for his work, he moved to Santa Rosa in the fall of 1875. Since that time, concludes "American Gardening," his work has been critically watched by students and business men throughout the country, and, indeed, the whole world.

**Mistletoe Plentiful.**

Covent Garden market is receiving its consignments of Holly and Mistletoe. Hampshire has, as usual, sent a good supply of Holly, and Normandy is not behind in its contribution of Mistletoe, which is plentiful. A great proportion of the Holly branches are well laden with berries. Prices being fairly moderate, there is a good demand.

**Byron Bay, New South Wales.**

Byron Bay, on the northern coast of New South Wales, forms the little known threshold of a beautiful district, rich in tropical or semi-tropical vegetation. "Here may be seen," remarks an observant visitor, "all sorts of splendid trees, shrubs, creeping plants, and Vines, growing in wonderful luxuriance. Perhaps the most beautiful of all is the bean tree, *Castanospermum australe*, well known for its handsome dark timber. This tree sometimes attains a height of about 200ft. Some of the gigantic nettle trees attain an equal height, with a diameter sometimes of about 8ft. In the magnificent brush grow also numbers of other handsome trees—the Teak tree, or *Flindersia*; the Rosewood, *Dysoxylon Fraserianum*, which has a red, rose-scented timber; the native Beech, *Gmelina Leichhardtii*, the silky Oak, *Grevillea robusta*, a most valuable timber tree; the red Cedar, *Cedrela toona*; immense Figs, whose huge thin buttresses extend from their stems for yards in all direction; and numbers and numbers of other plants too numerous to mention. The beautiful graceful bungalow Palms, which bear the ponderous botanical name *Ptychosperma Cunninghamii* may be met with in thousands. The cabbage tree palm, *Livistona australis*, also in many places abounds; and the beautiful little walking stick palm, *Kentia monostachya*, the Midginbill of the natives, grows here in millions. This is one of the prettiest and most graceful of the plants, especially when its bright red fruit is ripe. It grows sometimes to a height of 20ft, with stems not more than an inch or two in diameter."—J. P.

**Pineapple as an Aid to Digestion.**

Under this head the "Agricultural News," which is a fortnightly review of the Imperial Department of Agriculture for the West Indies, has a note which has an important bearing on the trade in tinned Pineapples. The flavour of these fruits and their price, as compared with that of the fresh-grown fruit have gained for them a very wide reputation, and tinned Pineapples are not despised even on the tables of the upper classes, so that Pineapples in this form have become a very large article of import, both from the West Indies and from the Straits Settlements. The fact of their containing a digestive ferment, to which the "Agricultural News" draws attention, is another and a strong recommendation to their use as a dessert fruit. For a long time the Papaw (*Carica papaya*) has been known to contain a valuable ferment known as papain, used as an aid to digestion, and the "Agricultural News" now refers to the fact that bromelain, the ferment of the Pineapple, is almost identical in its action with papain. Quoting from the "Lancet," it is stated that "the partaking of a slice of Pineapple after a meal is quite in accordance with physiological indications." Bromelain exerts a powerful action on proteids, digesting 1,000 times its own weight within a few hours. Fibrin disappears entirely, the white of eggs is digested slowly, whilst albumen of meat is transformed first to a pulpy gelatinous mass to be completely dissolved later. Cooking destroys the activity of the ferment, but the "Lancet" is of opinion that unless the Pineapple is preserved by heat, there is no reason why the tinned fruit should not retain its digestive power. On this the "Agricultural News" says: "Unfortunately for this hope, Pineapples are sterilised by steam-heat during the process of canning, the ferment being almost certainly destroyed. Unlike pepsin, the digestive principle of the Pineapple will operate in all acid, neutral, or even alkaloid medium, according to the kind of proteid to which it is presented. It may therefore be assumed that the Pineapple enzyme would not only aid the work of digestion in the stomach, but would continue that action in the intestinal tract. Pineapple, it may be added, contains much indigestible matter of the nature of woody fibre, but it is quite possible that the decidedly digestive properties of the juice compensate for this fact." With such important properties in the fresh fruit, it seems that there is an opening for someone to try his hand in preparing Pineapples for exportation without the aid of heat.—JOHN R. JACKSON, Claremont, Lympstone, Devon (in the "Tropical Agriculturist").

## Christmas.

There are still some Scrooges in the world who profess that they are influenced in no way by the season of Christmas. They wrap themselves in their selfish mantles, and look upon the preparations, the rejoicings, the meetings, and the festivities of the season as a parcel of silly sentiment. Let them do so. Nobody cares, so long as they will hold themselves aloof from the section of humanity that enters into the spirit of Christmastide, and not try to mar the enjoyment of others by attempting to overshadow them with their own wet blanket of discontent. It is not likely that the Scrooges will have their way. Christmas will always be, as it ever was, a time of peace and goodwill, a season when men's hearts open wider than usual, and they are moved towards their fellows with feelings of generosity and sympathy.

If such were not the case, and Christmas ceased to be what it is, can anyone realise the difference it would make, commercially and otherwise, to those who contribute directly and indirectly to the general make-up of Yuletide celebrations? A British Christmas! What a season it is! Though strictly a Christian festival, peoples of many lands, colours, nationalities, and religions contribute towards it; and what a connection there is between Christmas and horticulture! Gardens and gardeners have ever been inseparable to the season, and for long enough before the time preparations are going on in hundreds of establishments, but with one object in view.

### From a Horticultural Point of View.

In the first place, there is the decorative side, for the provision of which gardens and woodlands are mainly drawn upon. The bit of green, the red of the Holly berries, and the bunch of Mistletoe, have we lost our sentiment regarding them? Not a bit of it, and hundreds of wives and mothers when counting out the money from the limited stock for the purchase of modest Christmas luxuries, place a portion aside for the purchase of decorative material. In one house this is little enough, and you could cull as much from one corner of the garden and never miss it; but it means something when you consider the supply of a city. To realise something of what it does mean, go into any great central markets in London or elsewhere, and observe the great piles of evergreens that seem to arrive there by some magic means just before Christmas. One wonders where it all comes from, and where it goes to. It comes mostly from British gardens and woodlands, and is divided up, a bit here and a bit there, by the means of costermongers, dealers, fruiterers, and greengrocers, amongst thousands of householders, who, for old custom's sake, will have the Christmasy look about the home which is introduced by means of Holly-berries, Mistletoe, and evergreens.

For some years the writer was engaged in the supply of evergreens for the Christmas trade of that thriving city of Manchester. About a month before the time the work of cutting began, and all hands were busy carting and tying up the material into faggots, which were transferred to the Cottonopolis by the railway company. Trade was best when Holly-berries were plentiful, and it is surprising what the average decorator thinks of a few red berries at Christmas time. Fogs just before Christmas were tantalising, and sometimes caused serious loss when the market was brisk and prices good, and truckloads of material were lingering on the line hung up by the canopy of fog which hampers traffic so terribly. This is only one instance, and when one considers that the same sort of thing goes on in numerous other places one can partly realise what a drain there is on British Conifer and other trees for Christmas decoration. Anything green will not do, and decorators know the material they want. Holly is always in demand, the more so if it is berried. Ivy sells well, particularly if it has berries on it, and there is a steady demand for Laurel and Box. Rhododendron is not much good, as it flags so quickly, and there is little demand for Spruce, except for Christmas trees. Here, again, a happy Christmas custom has created a trade, and every season thousands of young Spruce are sawn off or dug up with roots for the Yuletide Christmas tree. They have their hour of

triumph when the branches are laden with presents and lit up with coloured candles, and happy children dance round them; but humiliation follows, and the Christmas tree, discarded and bare, ends its days in the backyard or in the dust-bin.

Except in a very small way, the supply of the mystic Mistletoe is not a home trade, and to see its extent you must be on the wharf when the steamers draw up and discharge their freights of crates containing the material which has such a peculiar and time-honoured association with Yuletide. It is grown on trees and land not English, and is cut and packed by people who neither speak our tongue nor share our customs; but they have learnt enough about us to know that Mistletoe is indispensable to a British Christmas, and that is sufficient.

And of late years flowers have played a great part in Christmas decorations, particularly so since market gardening under glass has become such an industry. In hundreds of houses there are late varieties of Chrysanthemums being kept back for Christmas, and in hundreds of others flowers are being forced out of their natural season for the same purpose. Gardeners in the Netherlands grow bulbs by the million, Lily of the Valley crowns, and roots of every other plant almost that will force for the supply of floral material for our British Christmas. By the extremes of cold and heat home growers place the flowers before the man in the street just at the appointed hour. They store up the forces that would have been expended naturally a long time before by means of retarding in refrigerators, and then by the aid of strong heat and good judgment remove roots, crowns, and bulbs from freezing cold to the opposite extreme, and time them so that the flowers come in on the day required. Brains, money, judgment, and enterprise at home and abroad all combine for the one purpose—that Britain may have its flowers at its Christmas festival.

And Yuletide is a time of eating, sometimes followed by dyspepsia and indigestion, but not if fruit plays its proper part in the diet. Who supplies the Christmas fruit? Gardeners, or fruit growers if you like the term better (though I fail to see a distinction), both at home and in every land where fruit is cultivated. Go into a Grape-growing establishment, and see the thousands of bunches hanging there for the Christmas market of those who can afford to buy hothouse Grapes, and for those who cannot pay the price asked, and yet would have Grapes. They come from climes where the Vine flourishes outdoors, and are palatable, even after their long journey in barrels of sawdust.

In his own little way the English fruit grower does something to contribute towards Christmas fare by saving his Blenheim Oranges, Cox's Orange Pippins, and other well-known Apples that are associated with the season, with the hope that he will get the best prices for them then. He is told that he ought to do more in the growing and storage of keeping Apples, and probably had; but in the meantime thousands of acres of fertile land in North America, Tasmania, and New Zealand are producing splendid Apples, and in growing and shipping them our relatives in distant parts of the world have got their eyes on the Christmas market in the old country. There is Great Britain, just a spot on the map of the world; but it is like a magnet, drawing to itself the products of almost every clime and race, and as Christmas time draws on the magnetic power seems to grow in strength.

Need I mention the ingredients of the time-honoured plum pudding, the mince pie, and the Christmas cake, that the garden does so much to provide? At home we do not produce Raisins, Currants, candied peel, and spices; but gardeners of other lands do, though perhaps they know nothing of a plum pudding and its association with an English Christmas. Our own modest contribution to the mince-meat in the way of fruit are the Apples, and it is quite likely they come from America, so that for our Christmas sweetmeats we have to depend largely on the gardens, climate, and fruits of other lands, where the sun ever shines, and the Christmas season is far different to our own.

And apart from the great question of national supply and demand, our private gardener working in the private garden knows the meaning of Christmas. He knows from experience that extra supplies of flowers will be wanted then, for it is a time-honoured custom for British families to spend Christmas at home. Fruit also has to be kept back for the

great occasion, and, besides the rush of decorations, there are a score of other duties that crowd themselves into a very short space of time at the Yuletide season. Thus the gardener is a busy man at Christmas time, but generally a happy one, as he enters into the spirit of the thing with true national zeal, and rarely fails to get a little pleasure out of the season in spite of its multitude of extra duties.

I could go on further, but I have said enough to show what Christmas means to gardens and gardeners at home and abroad, and my closing words shall be to wish the old Journal, its Editor, and everyone of its readers the compliments of the season.—G. H. H.

## Strong Men Come, when England Calls.

As the waves of the ocean press onward with their ceaseless roll, so in the lives of us all there should be some motive force which urges us to constant and strenuous endeavour. Rocks there always will be on the "sea of life," upon which some human vessels, both great and small, will for a time become "stranded," until by a mighty effort they reach smooth waters again, and learn by experience to keep a more vigilant watch in the future. The discoverers of old ran many risks in venturing on unknown seas, and to-day the man who will "launch" boldly into untried enterprises takes the risk which must ever attend a new venture; but the old adage, "Nothing ventured, nothing won," contains a truism which needs upholding as much to-day as of yore, because individuals with grit and enterprise are as the "salt of the earth," and a nation without "strong men" who have the spirit to take some risks in order to carry on a great and necessary work, must be drifting towards senile decay.

I must pause, however, or my pen will be recording thoughts which will bring a "hornets' nest" about my ears. Already I see in imagination a threatening gleam steal over the faces of some "Journal" readers, who, in the endeavour to fathom what I am driving at, almost see in the above remarks a dark hint at the "decadence of gardeners." Let me at once assure them that nothing is further from my thoughts, for, to my mind, gardeners, as a body, stand out as a bright example to the rank and file of workers in other callings, as they are ever willing to adopt new methods in which they can discern distinct advantages, and although hedged around by many restrictions.

It is surprising how much may be accomplished under adverse circumstances. No, I have no shaft to send against gardeners, who too often have to make "bricks without straw"; but I sometimes tremble for my country when in my travels I see the broad acres of lonely derelict farms, and when I hear of the fine crops they produced twenty years ago. The thought often rises to my mind what a different picture these dreary wastes would present in a few years if some of the best of England's struggling gardeners could be placed in possession under favourable conditions.

The old order of things in connection with the land has changed with a vengeance; but that is no reason why in the future a new order, as prosperous as the old, should not arise, if the problems are wisely dealt with as they crop up. The old style of farming has had its day, and however desirable it may be, it seems unlikely that the growth of many farm crops will ever again become really profitable. Dairy farming has been the saviour of many districts, and as the population increases it will doubtless be generally extended, to the advantage of all concerned.

Other great industries are, however, needed to snatch from the grasp of ruin thousands of acres of naturally fertile land, and to provide the England of the future with sturdy sons and daughters, who will gain their vigour from the healthiness of country life. If anything will bring about this improved state of affairs, I, for one, am strongly convinced that fruit culture will. "The Journal of Horticulture," for the last twenty years at least, has consistently urged the crying need for a great extension of the industry; and yet to-day there is more than ever before urgent necessity to plant certain kinds of fruit on an unprecedented scale.

The pessimists of old told us the thing was being greatly overdone, and yet our imports show each year an increase; and, what is more, the average price of good Apples and Pears has been higher during the last few years than ever before. During the same period nearly all manufactured goods have decreased in price, and land has fallen greatly in value. The public generally seem to have no idea of the enormous quantities of Apples imported into Britain annually; but they are well aware that when they get the well grown British article they have the best the world produces. We have the pessimists and the faint-hearted still with us. The former assert the thing is being overdone; the latter that only failure will come if fruit growing is practised except in what are now known as fruit-growing districts.

It is only necessary to travel and observe closely to see how fallacious either of these assertions are. In all counties there are soils and sites splendidly adapted for growing fruit trees. In the western and midland counties the climatic conditions are such that crops are produced quite as regularly as in any of the southern counties, and during some seasons the fruit is as fine as that grown in any county. The fact is that great fruit-growing centres will spring up in various places in the future as they have done in the past, and counties which were once considered supreme will have to yield the palm to younger aspirants to such honours.

No one has urged more constantly the importance of selecting suitable sites where the soil is good before planting fruit trees, but there is plenty of land possessing all these advantages in many counties. I could point to many districts where there are a few isolated orchards which have quite a local reputation for their fruit, and as there is plenty of similar soil around, planting on a large scale would convert such districts into prominent fruit-growing centres. No, there is plenty of suitable soil in England capable of growing all the Apples we require between August and March. If it is selected with judgment, and not pitched upon in a haphazard way, then, with thorough preparation of the soil and good planting, combined with a careful selection of varieties, failure could only be a remote possibility. The rental value of such land in suitable positions might be increased tenfold in ten years by planting it with Apples and Pears, and there is need at the present time for "strong men" with power behind them to forge the links which shall connect present scarcity with future plenty.—ONWARD.

## FIGS UNDER GLASS.

**EARLY FORCED TREES IN POTS.**—To have ripe Figs in April the trees must be started not later than the new year, and they must consist of the early varieties, and such as hold the first-crop fruits, than which there are few to equal the small fruited but excellent Early Violet and St. John's, the latter a greenish-white Fig of fair quality and medium size. These free-bearing properties, however, depend on the trees not carrying heavy second crops the previous year, and on the autumn set being on sturdy, well ripened wood. Angelique is also a good forcer, and so is White Ischia. For general purposes Brown Turkey surpasses all others, being good in both first and second crops, but it must not bear the latter on the points of the shoots, nor too many of them at the base, or the first crop following will not be satisfactory.

A slight warmth at the roots is highly beneficial, but even this has its disadvantages, as when the heat at the roots is 70deg or more during the early stages of growth that is forced too rapidly; therefore see that the temperature at the base of the pots is not more than that until the leaves are unfolding, when the heat may be 70deg at the base of the pots.

The temperature of the house should be 55deg at night, gradually increasing to 60deg and 65deg in the daytime, 5deg more in mild weather, and 70deg to 75deg with sun heat and moderate ventilation. It is better, however, to bring the trees on slowly rather than quickly, especially in dull weather, as foliage produced under such conditions is not of stout texture, but thin and liable to scorch under bright sun and to fall an easy prey to red spider. Water in a tepid state must be supplied to the roots as required, and the trees and house syringed morning and afternoon, damping the house later on, but not the trees, as it is desirable to have the foliage fairly dry before nightfall.—GROWER.

#### **Chrysanthemum, Mrs. D. V. West.**

This snow white Japanese variety, illustrated on the foregoing page, was raised in Australia, and was seen in splendid condition at Mr. Godfrey's nursery in November. It is said to retain its foliage better, and come easier than Madame Carnot, which it somewhat resembles. It is in all respects a good Chrysanthemum.

#### **Two Good Oaks for Planting.**

There is no question of the beauty and utility of the Pin Oak, *Quercus palustris*, for ornamental planting and for shade. Wherever planted, whether as a specimen tree on lawns or lining avenues, it does well. There are in its bright green summer foliage and its broad cone-shaped growth characters very pleasing. It is not alone these merits which make this Oak so popular. There is another and very important one which has had very much to do with its popularity, and this is that it is an easy tree to transplant, as nurserymen term it. As much of its popularity is due to this fact as to the value of its appearance. It would be supposed that all trees of a genus would be alike in respect to transplanting, but it is not so with the Oak. Set out a red, black, scarlet, or Chestnut Oak at the same time a Pin is planted. The latter will do by far the best. The others must be closely pruned to have them succeed. The Pin Oak appreciates a pruning, but does not demand it. It is because a customer finds his Pin Oaks live while the others have a struggle for life, that he orders this Oak again and recommends it to his friends. But there is another Oak which transplants as freely as the one named, yet it seems unknown to general planters. I refer (says Mr. Jos. Meehan) to the *Q. bicolor*, one of our massive native Oaks. Its foliage is very large, the opposite of that of the Pin Oak, and the tree has rough bark when young, somewhat in the way the red Birch has. Where a very large growing Oak, of a character of growth the opposite of the Pin, is desired, try the bicolor, and remember that it and the Pin are two Oaks that rarely fail to grow, having lots of small roots.

#### **Fever in Plants.**

Although animals and plants seem at first sight to be two absolutely distinct groups, and to have little in common, closer investigation points unmistakably to the fact that they are very similar and very closely related to one another. Further, many organisms are known which it is impossible to class with certainty as plants or animals. Let us confine our attention for a moment to one of the ordinary recognised signs of life, namely, breathing or respiration. Both animals and plants breathe. In both oxygen is taken in from the air, and after certain changes carbon dioxide is given out. This process, it is true, is masked in green plants during exposure to sunlight by another process, in which carbon dioxide is taken in and oxygen given out. It goes on, however, in a plant as steadily as in an animal, and there is no essential difference between the respiration of man and that of the humblest vegetable he cultivates. In man it is not uncommon to find that when the health is affected his temperature rises; in other words, he becomes feverish. At the same time the rate of breathing is often increased. Is this true of plants also? Can we throw a Potato or an Onion into a fever? The idea seems absurd. Yet it is an ascertained fact. It was shown by Mr. H. M. Richards ("Annals of Botany," vol. xi., page 30) that if Potatoes or Onions were sliced—that is to say, wounded—their temperature rose, and their breathing became more vigorous. They exhibited, in fact, two of the characteristic symptoms of a feverish person. The rise of temperature was carefully measured: in some cases it was as much as 3deg C. The course of the fever was followed, and was found to reach its height usually about twenty-four hours after the injury; the temperature then began to fall, and reached the normal again on the fourth or fifth day. Experiments such as these help to bring home to one in a striking manner the fundamental relationship between animals and plants.—("Agricultural News," Barbados.)

#### **The Flora of Egypt.**

From the fertility of the Egyptian soil we might expect a specially rich flora, but, notwithstanding the luxuriant vegetation, no country in the same latitude has so poor a variety of plants, and wild flowers are scarcely to be found. There are no plants common to ruins, bogs, or lake, for want of water and shade. The grasses, of which there are a goodly number, never form a green sward; there are no meadows such as charm the eye in other countries, though the clover fields, which serve for pasture, and the corn fields, as long as they are green, compensate to some extent for the deficiency. Even the streams, the numerous water-courses and canals, plantations, with various trees bearing fruit, and the Tamarisk is to be seen everywhere. One of the finest avenues in the world extends from Cairo to the Pyramids, seven miles long, lined with Sycamore and Acaia trees. It was constructed in three months' time by the Khedive in honour of the Empress of the French at the opening of the Suez Canal.

#### **Fruit Pulping.**

An account is given in the annual report on the Saharanpur and Mussoorie Botanical Gardens of some experiments made in the new Californian industry known as fruit-pulping. The idea is to boil down the fruit until it has assumed a semi-solid condition and then evaporate the remaining moisture, so that the pulp can be wrapped in oiled tissue and packed in an ordinary deal box. Experiments were made with Peaches and Mangoes, but the result was not encouraging. One hundred and fifty Peaches, weighing 19½ lb, produced 2 lb of dry pulp, costing 12 annas per lb, without counting the cost of stoning the fruit, boiling, straining, evaporating, putting up the bricks in an attractive form for sale, &c. Thus the cost of producing Peach-pulp bricks is at least 1 rupee per lb; and as the better class of Peaches sell readily at 2 rupees to 3 rupees per 100, and second-rate fruit at 1 rupee per 100, it would not be worth the time and trouble of growers to adopt the pulping system. Moreover (says the "Madras Mail"), it was found that the pulp-bricks would not remain hard and solid for more than a few days in the moist climate of the rains.

#### **Mistletoe.**

As Christmas comes round one's thoughts naturally turn to Holly and Mistletoe, and it is with the latter that we propose dealing in the following lines. Known as *Viscum album*, a name which fully describes its white, viscous berries, it is a native of this island, though not confined thereto, as much of that vended at Noël tides is grown in the Apple orchards of Normandy. It is, however, very plentiful in many parts of the south of England, where it is to be found on Apples, Pears, Hawthorns, Limes, Sycamores, and Poplars indiscriminately, and, much as it may surprise some of our readers, very rarely on Oaks. In Sherwood Forest there is a clump of ancients covering many acres, nearly every tree of which bears its Mistletoe boughs. Old Culpepper tells us that the Mistletoe "flowereth in the spring-time, but the berries are not ripe till October, and abide on the branches all winter." The plant is a parasite, and the berries are a favourite food for thrushes, who propagate the plant by wiping their beaks, against which the glutinous seeds have adhered, against the bark of the tree on which the bird has alighted. The growth of the plant is very slow, and hence it is very difficult to eradicate when once it has become firmly fixed, as the smallest particle of roots will continue to send out shoots.

Almost needless to say, legends galore have clustered around the plant, and the majority of them can boast of a very respectable antiquity. Our ancestors attributed to it miraculous virtues. Albertus Magnus believed it would open all locks, Aubrey tells us how some persons who cut down Mistletoe at Norwood and sold it to apothecaries for drugs were stricken with broken legs and blindness in consequence; while the Druids considered it capable of healing all diseases and acting as an antidote to every poison; while the old herbalists prescribed it as a panacea for apoplexy, epilepsy, palsy, and falling sickness—truly a wonderful plant if we could only believe it all! Really it seems quite a demoralising use to put such a grand old humbug up at Christmas parties for the young folk to kiss under.—W. U. B.

### The Chrysanthemum Audit.

Mr. Molyneux very justly remarks that it will be difficult indeed for any person to cavil at the selection of varieties in his analysis given in the *Journal* last week. I have compared this audit with that of 1898, only four seasons since, but oh! what a difference! That audit seems now to be ancient history. It is very interesting to note the "ups and downs" of some varieties, and, on the other hand, the persistency with which others keep their good positions. *Australie* is one of the latter, and yet it has little to recommend it besides its size and easy culture. The tall habit of the plant goes very little against its popularity. It is very remarkable to note what a large number of newcomers are admitted to the fifty, most of which had poor positions as outsiders in the last audit. *Bessie Godfrey*, the top in the list of last season's novelties, has now 24 votes (out of a possible 27); *Madame Paola Radaelli*, 23; and *Ethel Fitzroy*, 22; all of which only received 4 votes last season. *Duchess of Sutherland* has 22, against 2 of last year; and *Mrs. T. W. Pockett* the same number of votes, against 1 last year. *General Hutton*, 20, against 2; *Sensation* receives 21, against 3; whilst *George Lawrence*, *Godfrey's Pride*, and *Mrs. H. Emmerton*, each not mentioned in the last audit, now receive 14 votes apiece. *Maferking Hero*, another not mentioned in the last, has now 21, but it was introduced the preceding season, so can hardly be classed as a novelty.

Twenty-one electors vote for *Miss Elsie Fulton*, against 4 in the last; and 6 vote for *Princess Alice de Monaco*, against 2 in the preceding audit. The first named was supposed to have been raised by the Maidenhead firm, and purchased by the Ryecroft firm, and sent out two seasons ago. The last named is from *Mons. Nonin*, and was sent out about two years previously. The newest arrival has by far the best position of the two, yet it would be an interesting topic if the voters would inform the *Journal* readers where the two differ. Personally, I believe that there is no difference, and the older variety has been rechristened. Some of last season's novelties cut a very poor figure indeed, but the season may be responsible for this.

I do not care to say much about my own varieties, but I am certain that *Exmouth Crimson* will prove much better than its present position gives it. *Mrs. E. Hummel*, with 9 votes, against 0 in the previous audit, will "go up" considerably next year, or I am mistaken. It is infinitely superior to *Mr. J. Bryant*, being very much larger and deeper, although somewhat of the same colour. *Nellie Bean* will also rise, and *Miss Lucy Evans* should also obtain a better position. It is very remarkable that *F. S. Vallis* receives 19 votes, and yet when I placed three magnificent blooms before the Floral Committee of the N.C.S. it was passed, as being too much like *G. J. Warren*. The voters seemed to have formed a better opinion of it than the members of the committee, and it is doubtful whether they have seen the variety in such fine form as were the blooms mentioned.

I consider the weakness of the audit is that the votes are recorded not in accordance with the personal experience of the voters gained by growing the varieties voted for, but rather from the blooms they have seen. For example, it is probable that none of the electors have grown either *F. S. Vallis* or *Madame Waldeck-Rousseau*, for the stocks of both of these varieties have practically been confined to the trade. It then resolves itself in some measure, and especially with the new varieties, as to what facilities an elector has had for seeing blooms. Now, as another example of the argument, had the twenty-seven electors seen the fine flowers as staged by *Mr. T. Lunt* at the Edinburgh Show, *Princess B. de Brancovan* would have received three times the number of votes (8) which are now recorded for it. Again, *Miss Elsie Fulton*, or *Princess Alice de Monaco*, would have the premier position for the best white variety had all seen it in the form in which it has been staged. Still, *Mr. Molyneux* remarks: "A selection of varieties under the method adopted appears to better illustrate the opinions of those best calculated to judge as to the selection of a

collection as compared to the making up of a list of those varieties exhibited at any prominent show like that of the N.C.S. or Edinburgh." Yet it was mainly at these two shows that *F. S. Vallis* and *Madame Waldeck-Rousseau* got into favour. Candidly, I am not so much gone on the last named variety as are some. It has size, and that is its chief recommendation; the colour is a bit dull, and with an ordinary season may be more so. Still, it must not be overlooked by up-to-date growers.

The more the audit is examined the more interesting it becomes. It shows the varied opinion of what is certainly the best combination of leading growers and most prominent exhibitors in the kingdom. Let us take a few of the most popular varieties, to wit, *Mrs. Barkley*, *Madame Carnot*, *Edwin Molyneux*, and *Lord Ludlow*—four typical varieties—and yet there are some among the electors who would not place them among "the best fifty," which means that they know fifty varieties which are superior. Now it is reasonable to suppose that at some time or other these varieties have been seen by the electors in remarkably good form, and, judging by these flowers alone, the electors would have placed them among "the best fifty." Having grown them, they are not to be biased in their opinion because some do grow them to perfection. *Lily Mountford* only gets 16 votes out of a possible 27, which is rather disappointing to many growers, whilst *Mrs. H. Emmerton* has 14, and, I believe, time will prove that this variety is placed too high; also that *Madame Herwege* will prove a better variety than *Nellie Pockett*. This last and *Madame Gustave Henri* should receive little encouragement, for the white is not clear enough generally. After having tried it for two seasons, I would recommend growers to try *Madame* (not "Mrs.") *Magelmackers*. It is of the build of *Madame Herwege*, and is full of promise.

In the last audit I wrote as follows: "There are many which are now out of the 'fifty,' but are 'mentioned,' which will find a place in it next year; whilst many, including *Mutual Friend*, *Lady Ridgway*, *Madame Gustave Henri*, *Henry Weeks*, *Pride of Madford*, *Madame P. Rivoire*, *Mrs. Palmer*, and perhaps the *Vivian* and *Morel* family, will be superseded." In the present audit, with the exception of *Madame G. Henri*, all are outsiders. In the incurved section I note that *Countess of Warwick* and *Mrs. W. C. Egan* are again mentioned as distinct varieties, when

CHRYSANTHEMUM MRS. D. V. WEST. (See page 584.)

they are considered to be identical. Madame Durandel, I believe, is the same as that introduced from France several seasons since as Durandel.—W. J. GODFREY, Exmouth.

#### Miss Alice Byron.

I think this variety proved one of the surprises of the past exhibition season, for, although most growers have admired it, I guess few of them a year ago would have advocated its growth as a first-class exhibition variety—nearly all our growers were of opinion that it was too small for the boards. Now I note that it secured twenty-one votes in Mr. Ed. Molyneux's excellent analysis, published December 18, while the highest number recorded is twenty-seven. This speaks well of it for next year's culture. I shall expect to see it higher still in the list next year. Now, apart from its exhibition qualities, it will be known pretty generally in the future as a capital white for cut flowers or decorative plants in the month of December, for it comes most kindly on the terminals, and I have a few really good plants of it for Christmas decoration.—B. R.

#### New Forms Wanted.

I had hoped (writes R. Dean in an American contemporary) the Plant Breeding and Hybridisation Conference, recently held in New York, would have been the means of developing some new suggestions in the direction of obtaining new breaks in Chrysanthemums. We make but little advance with the flower except in the direction of size. New types of Roses and Begonias are forthcoming; the Chrysanthemum appears to be practically barren in this respect. I can foresee the time when there will be a revolt of popular liking for these huge blooms, and when the first indications of this appear, experts should be prepared to put forward some other type or section of blooms, so that there may be secured a transference and not a loss of popular favour and support. One new variety is, after all, so much like another that the cry may soon be started: "Who will give us something new?"

#### Christmas Chrysanthemums.

Happy is the man with a good display of Chrysanthemums in his conservatory at this season; and disappointed is he who has to depend upon smaller subjects for a display. The latter may be had in good variety, but they do not give the bold effect produced by a varied assortment of "Mums." But it is useless bemoaning our fate, for after all it is the growers' own fault; for there are plenty of good varieties for the purpose, and they do not require the elaborate attention necessarily bestowed upon the exhibition varieties. Then, again, we can grow them to any size we like; it is merely a detail of cultivation. Where large plants are desired, the cuttings may be inserted in January or February; while for small pots, such as 5in and 6in, April or May will be quite soon enough. Four or five cuttings should be rooted in pots for large work, and they will make grand plants in No. 16 pots. Their cultural requirements are precisely the same as for the general stock, but it is a *sine qua non* that they must grow to the terminal buds. The latter may be disbudded or left in sprays at the wish of the grower, though some varieties are better disbudded, and others vice versa. When housing care should be taken to give the plants elbow room, so as to avoid mildew and damping of the foliage. Naturally they will not require much fire heat, only sufficient to keep out the frost. Very little feeding should be resorted to, or it is inclined to make the blooms thin in petal, which is very much against their keeping properties.

This season most of the naturally grown plants are later than usual, but the following varieties are good just now:—Niveus, the well-known white, later than usual; its yellow companion, Pride of Ryecroft; Framfield Pink, a good sturdy variety; Western King, white, very good this season; Lord Brook, bronze, rather tall, but otherwise good; Mabel Morgan I have for the first time, and I am under the impression it will make a grand yellow for Christmas; Miss Alice Byron, white, will be largely grown for late work when better known; R. Hooper Pearson, a rich yellow; Mrs. C. Bown, a glorious white for December, with a nice short growth; Mdle. Thérèse Panckoucke, white, very free, but a tall grower; Matt. Hodgson, a bronzy red; Madame A. Rousseau, pink, very free flowering; Tuckswood White, another good white; Putney George, red, and a short grower; Major Plumbe, beautiful yellow, though too tall; L. Canning, dwarf white, well known; Guy Hamilton, ivory white, dwarf, and very free. The new white pompon Lula is very beautiful just now, and promises well. Col. T. C. Bourne, deep red, dwarf; Georgina Pitcher, yellow, rather tall; and Mrs. A. Tate, bronzy red.

It will be seen that there are most whites and yellows, while there is more or less of a famine in the red forms. I often wonder why our raisers do not attempt to produce some really good novelties in the late kinds. Surely it would pay to do so, for the demand from the large market growers would

compensate well. They are always on the look-out for really good late varieties that are of sturdy habit with good foliage and bright decided colours.—J. B. R.

#### Chrysanthemum Mrs. E. Thirkell.

Writing to the Editor of the "Florists' Exchange," the undersigned says: "I noticed the account of a Chrysanthemum in many of the trade papers, which is attracting considerable attention as an exhibition variety. There were two blooms shown at Chicago, under the name of Madame Thirkall. Being interested in all new-comers, and desiring to know of the origin of this one, I have, after some searching, been able to locate the variety. The correct name is Mrs. E. Thirkell; it is one of Mr. Thos. Pockett's seedlings. Herewith I append a description, as given in the catalogue of G. Brunning and Sons, who are noted Australian raisers: 'Mrs. E. Thirkell, very deep yellow, late flowers,

M. C. Cooke., M.A., LL.D., V.M.H.

bronzy yellow, extra large, grand exhibition variety, best on late crown buds.' I furnish you this information with the hope that all parties cataloguing this Chrysanthemum may adopt the correct name, and thus avoid confusion.

—ELMER D. SMITH.

"P.S.—W. Wells and Co., England, catalogue this variety as Mrs. E. Thirkell. Brunning and Sons handle all the Pockett novelties [as do Messrs. Wells and Co.—Ed. *Journal of Horticulture*], and are likely correct.

E. D. S."

#### MORDECAI CUBITT COOKE, M.A., LL.D., V.M.H

Dr. M. C. Cooke is one of the most useful members of the Scientific Committee of the Royal Horticultural Society, and in recognition of his unfailing assistance in matters of plant disease brought before that body, and also in honour of his prolonged labours in the field of Cryptogamic Botany at Kew, the Council of the R.H.S. have bestowed on him the Victoria Medal of Honour. The main points in Dr. Cooke's most interesting career are summarised in that useful publication entitled "Who's Who," from which we learn that the latest Victorian Medallist was born so long ago as 1825, on July 12, at Horning, in Norfolk. His parents kept the village general shop, such as is usual in country villages. As a lad, Mordecai C. Cooke attended the village school till nine years of age; thence was educated by an uncle, a Dissenting minister. He was elected an Honorary M.A. of St. Lawrence University, U.S.A., in 1879, and M.A. of Yale, U.S., three years later. However, he had qualified in various branches of business before these honours were gained. In his youth he had been apprenticed to the wholesale drapery trade, then he became an usher in a boys' school, anon a lawyer's clerk, and for nine years a certificated teacher in a National school. In the year 1860 he was appointed to the India Museum, London, and later was transferred to Kew Gardens, where, as we have stated, his time was largely devoted to Cryptogamia. Dr. Cooke's chief publication is his "Introduction to the Study of Fungi" (1895), but he is author of forty other botanical works. He is an Associate of the Linnean Society, and a member of many other scientific bodies.

### Four-Flowered Tulip.

Respecting the four-flowered Tulip depicted on page 546, I may say there is a branching Tulip on the American market. It is asserted that it produces two or three flower stems per bulb, each of which branch, so that five to eight flowers are borne from each bulb. In colour it resembles Keizerskroon, and is said to force well.—T. A. W.

### Illegal Showing.

I am glad to see that Mr. W. R. Raillem has come into the fighting line on this important discussion, and thanks also to Mr. Taylor's outspoken remarks. I will leave it to more able pens than mine to point out to the miscreants the value of a prize honestly won in comparison to any obtained by fraud. Surely a man must be a hardened sinner if, when his friends, fellow-exhibitors, and the Press are loud in praise and congratulation to him on his success, his conscience does not prick him when in his inmost heart he must know that he has no legal or moral right to either. Does he ever consider the enormity of his misdeed? We will suppose there are six exhibitors in a class, and the first prize is awarded (not won) to a false exhibitor. He deprives the second and third prizewinners of their proper awards and positions. And what about the fourth person, who is out of it altogether, and who probably returns home out of pocket, disheartened, and with weakened reputation? If the head gardener at the hall, manor, or castle resorts to unfair means, it is almost a certainty that one or more of the men serving under him will know that all is not grown on the place. I myself have known places where it was common knowledge with the outdoor men. And when this state of affairs exists, what can be expected from cottagers? The more one probes the matter the worse it becomes, and there seems no end of its evil effects. I would say to those who have sinned, Sin no more, but brace yourselves up, and in future stand or fall on your merits. Friends and acquaintances with whom I have discussed the subject have sometimes replied that they *all* do it, meaning all exhibitors. This assertion, I am quite sure, is not correct. But if ninety-nine out of one hundred did it, it would not make it an honest practice. I entirely agree with your correspondent who suggests that honest exhibitors and committeemen should band themselves together and fight this evil. If they will, do this I am convinced good will result. They must not, however, confine their efforts to their own show, but be on the alert to give information to neighbouring committees. To make my point clear, I myself during the last three seasons could have given information very damaging to some exhibitors at a show eight miles distant from here. When people have the audacity to drive round collecting, and sometimes purchasing, the best that is for sale just previous to an exhibition in their village, I fail to see that it is a very difficult matter to unravel, if officials are ready and willing to perform the unpleasant as well as the pleasant duties pertaining to their office. Some buy their exhibits at one exhibition to take to another. Thus, one lot of Onions or Tomatoes may do for three or more shows should their dates follow closely. Quite recently a prizewinner told me that a gardener wanted to buy his dish of Tomatoes. Does anybody suppose they were wanted for himself or his employer? They might have been, of course, but I happen to know they were not.—G. G. H., Bath.

The only salve as yet prescribed for this sore appears to be that of official inspection of produce *in situ* prior to a show. If that is practicable in a small way, that is, within a circumscribed area from which exhibits are drawn to a local centre, it might prove efficacious so far as it goes, but it certainly does not go far enough to cover an exhibition of contributions from the four quarters of the British Isles, and it is here, I take it, that illegal showing reaches its most rampant form. For instance, say, an autumn (or winter) show, the chief constituents of which are "Mum" blooms and fruit, and for "tricks" of trade commend me to these two great sections, held in Fogopolis, Cottontown, Cakeville, or where you will, what check could obtain over Trickymen's exhibit from Swindleton, 200 miles away? It seems a pity that, before this matter dies out, something wider, farther reaching, and more definite could not be evolved instead of leaving it as a legacy for the next generation to tackle, when exhibitors (honest ones) of this degenerate one, are all in the better land. The scheme of inspective surveillance might, of

course, be experimentally started at cottage shows, or small local exhibitions, but I fail to see how the principle could apply to the high places, and cause the seats of the mighty, to be mighty uncomfortable for them. No. I guess that won't work, and I guess I'll give it up, as I gave up showing years ago, in disgust.—Quiz.

### Gardening and Inventions.

Many persons would hail the meritorious beginning which recently had been made in the Journal with a bearing on the application of the genius of invention to gardening. The spark which was kindled fanned for a time, and, indeed, bade fair to illumine the dark corners of this conservative art, but, like the meteoric flame which crosses the dark arch of the heavens on a moonless night, the glow as suddenly died away in the depths of apathy as the other in the depths of space. This will be considered by many a most decided and regrettable pity, for it is scarcely creditable that in such an immense army, shall I say, of men such as comprise the profession of gardening, no disposition of the inventive faculty should be discernible. Personally, I would fain believe that the profession commands its share of the genius of invention, but in my experience I found a very pernicious agency in the composition of the average gardener which acted always as a deterrent influence in the free course of the presence of such a gift. Perhaps something of this nature accounts for the meagre response which the opening of the subject received from the readers of the Journal. At any rate, I hope the lapse of the subject is not traceable to a growing spirit of diffidence on the part of the gardener. If so, I must say it is altogether new to the pristine character of the profession. In days gone to return no more, the intellectual calibre of the profession was indicative of no smaller symptoms of the inventive faculty as applied to gardening than found among other trades and professions. I trust, whatever may have been the cause, that it shall speedily be removed, and that every man who is in any way connected with gardening will put on record the little discoveries he may have made from time to time, to lighten the yoke of a heavily laden art.—ASTER.

### Judging Cottage Gardens.

It is scarcely necessary to say that the conditions of cottage gardens to-day are vastly superior to what they were some four years since. Nor is the cause far to seek; for, as well as county councils and other public bodies, the owners of many estates give prizes for the best cultivated cottage gardens, and also hold annual shows for the exhibition of their produce. It is very satisfactory to notice the increasing interest that is taken in these gardens, not only in the neighbourhood of our large towns, but in the country as well. The cultivation is more intelligent, and the desire to know the why and wherefore of things. We also find that the owners of these gardens are much more conversant with the different varieties of fruits, flowers, and vegetables. My reason for penning these notes, however, is to give a few methods for judging cottage gardens, upon which I have had to work. One before me, which is copied from the schedule of an exhibition of cottage gardens, is as follows: "Each competitor will be judged on twelve articles, six compulsory, viz., Potatoes, Turnips, Cabbage, Onions, Leeks, Peas; for each of which twelve points is the maximum. Six others must be chosen from the following by the competitor, viz., Beans, Beetroot, Parsnips, Parsley, Carrots, Celery, Lettuce, Rhubarb, Cauli-flowers, Curly Greens, Savoy, Vegetable Marrows, fruits, and flower borders; for each of which eight points is the maximum." This is an expeditious method of judging.

On some estates a list is sent round early in spring giving a list of articles for which points may be obtained, the maximum of all articles being equal. This list is written in a book, and the pages ruled in columns, each column representing a garden. In judging, all that is required is to add the number of points obtained by the competitor opposite the respective articles in the list, the name of the competitor being written at the top of the column. A similar method is used in some places, but instead of pointing all things equal, the most important crops, such as Potatoes, Onions, Cabbage, &c., have a maximum of, say, six points, whilst the less valuable have a maximum of four points. A method, which I do not consider a very satisfactory one, is to point all that is found in the garden, allowing the same maximum number of points for all crops. This makes a great deal of work for the judges. It also induces competitors to grow things that are not of very much value to them simply to gain extra points. Points should always be allowed for order and cleanliness. In some country gardens are found a number of large fruit trees. Some consider that points should not be allowed for fruit when the trees have not been planted by the present occupier. There are constantly points cropping up in connection with this work that are difficult of solution. I should be glad if any correspondent of the Journal would give what

they consider to be a really expeditious and satisfactory method of judging cottage gardens, especially in relation to fruit trees.—J. S.

### Bothy Plan Competition.

I was rather surprised to read Mr. Rabjohn's "wail" in the current issue of the *Journal* re the above. Why not, like the rest of us, have a try with a modest attempt? It is not possible for everyone to compete successfully, but even an attempt would do us no harm, and it will, no doubt, be some practice. It is the same with a competition of this description as with exhibiting—the more competition the more honour in winning, or being beaten by a worthy competitor. If we are beaten, we find out our weak points, and can strengthen them accordingly when the opportunity arrives for another attempt. I am sending my modest attempt, and am sure it has been a pleasant pastime for a few evenings, and an experience which cannot but be most helpful.—J. WILKINSON.

## Societies.

### Birmingham Gardeners'.

The fortnightly meeting of the society was held on the 15th inst., Mr. W. B. Latham in the chair, who was supported by a good attendance of the members. Mr. J. Udale, County Council Horticultural Lecturer for Worcestershire, gave a very interesting and pertinent dissertation entitled "Hardy Flowering Shrubs in Relation to Landscape Gardening." The essayist's main object was to demonstrate the arrangement and massing of flowering shrubs with a view to produce a good effect by the harmonious blending of their inflorescences. Consequently it would be necessary to select shrubs that would flower as nearly as possible simultaneously. The massing system—where admissible—was advocated in preference to the more common one of the intermixture style of planting. A wealthy list of suitable trees, shrubs, and sub-shrubs, was enumerated as applicable for the purpose indicated. Reference was also made to a more extended embellishment of waste tracts, and spots of such as pertain to the mining districts of the Black Country by a proper preparation of the soil, and a suitable selection of trees and shrubs. An animated discussion, in which Messrs. Latham, W. Spinks, C. H. Herbert, Walter Jones, and W. Gardiner took part. A collection of choice dessert Apples was exhibited by Mr. G. Stacey Harborne—grown by a friend in Worcestershire—with a view to enable members to select varieties for future planting.

### Royal Meteorological.

The monthly meeting of this society was held on Wednesday evening, the 17th instant, at the Institution of Civil Engineers, Great George Street, Westminster, Mr. W. H. Dines, president, in the chair. Monsieur C. A. Angot, of the Bureau Central Météorologique de France, Paris, and Professor Willis L. Moore, of the U.S. Weather Bureau, Washington, were elected honorary members of the society.

A paper by Mr. C. V. Bellamy, M.Inst.C.E., on the "Climate of Cyprus," was read by the secretary. This island, which lies towards the extreme eastern end of the Mediterranean Sea, covers an area of 3,584 square miles. It is divided through the centre by the Central Plains, which run east and west, and which are bounded on the north by the Kyrenia Mountains and on the south and south-west by the Troödos Mountains. These mountain ranges have a considerable influence upon the temperature of the central plains, and more especially upon the climate of the capital city, Nicosia, which has a population of about 14,000 inhabitants. The mean temperature for the year at Nicosia is 67.2deg. the extreme highest temperature being 108deg. and the extreme lowest 28deg. The annual rainfall is about 14in, which falls mostly in the winter months. The author also gave particulars as to the meteorological conditions at Troödos, the sanitarium and summer resort of Cyprus, which is situated in the mountains at an altitude of over 5,000ft above sea level.

A paper by Mr. H. H. Clayton, of the Blue Hill Observatory, U.S., on "The Eclipse Cyclone of 1900," was also read by the secretary. The author in a former paper discussed the meteorological observations made along the path of the total solar eclipse in the United States on May 28, 1900, and stated that he found that a cyclone followed in the wake of the eclipse, though the changes were very minute and feeble, the fall of temperature developing a cold air cyclone in an astonishingly short time, with all the peculiar circulation of wind and distribution of pressure which constitute such a cyclone. This theory was not readily accepted by meteorologists, and Professor Bigelow, who has discussed all the observations received by the U.S. Weather

Bureau, thinks that they scarcely confirm Mr. Clayton's conclusions. The author now examines Professor Bigelow's discussion, and points out that the observations really confirm his own statements.

### Ipswich Mutual Improvement.

The last meeting of the year of this association was held on December 18, with the president, Mr. R. C. Notcutt, in the chair. A most interesting paper on the "The Sweet Pea Family" was read by Mr. S. J. Batchelder, lecturer on botany at the Ipswich Science and Technical Schools, who illustrated the various points of his lecture by an admirable series of lantern slides. Taking the Sweet Pea as a type, Mr. Batchelder first described the structure of the flower, and then passed on to the consideration of other common plants of the order, such as the Broom, Furze, Vetches, Clover, &c., noting particularly the adaptability of the plants to circumstances, exemplified by the Vetches and Peas in the formation of tendrils, with which to climb and expose their leaf surface to the light and air; by the production of spines in the case of the Furze and Rest Narrow as a protection against injury by animals; and also by the many arrangements for securing cross-fertilisation of the flowers by insect agency.

He also referred to the remarkable sensitiveness of the leaves of leguminous plants to changes of light and temperature; and concluded by discussing the views now held with regard to the nutrition of the Leguminosæ in connection with the bacteria found in the root nodules. Mr. Batchelder's remarks were followed with evident enjoyment, and at the close of a brisk discussion, in which many took part, a vote of thanks was carried with acclamation.—E. C.

### BRUSSELS SPROUT, SOLIDITY.

The Brussels Sprout, which we are here able to illustrate, by the kindness of the possessors of the stock—Messrs. Alexander and Brown, Perth, N.B.—is a very meritorious variety. From

A Good Variety of Brussels Sprout.

a gardener in the Bridge of Earn district we received "a sampling" of the Sprouts, and in all respects they were satisfactory. They were large, firm, without being absolutely hard, and tasty. The plants grow sturdily (2½ft), and button from base to top, as shown in the illustration, which is from a photograph.

## Young Gardeners' Domain.

### An Old Boy's Greeting.

What of the New Year, young brothers? And what of yourselves? Are you going ahead, keeping pace with the remorseless tick of Time? If so, pass on, all's well. If not so, pause on its threshold and consider, so that at the next knell of a dying year the retrospect then may be brighter than the outlook now. Wise, is it not, to do so? Yes! You agree with me. Then not to do so is otherwise; downright foolish, in fact. Then on, on; no standing still. Everything is moving rapidly; but, mark you, don't lose yourself in the hurrying scurrying crowd, to be carried hither and thither as an inconsequential atom, trusting that somehow, somewhere, and somewhen you will drift into something, settling down respectably like a bivalve on a rock, merely existing to growl at fate generally, and the rotten state of gardening in particular. If you are but an atom in the mass of homogeneous humanity, be a mighty atom. Feel that you are of some consequence in the gardening world; for you are. Feel that fate is in your own hands; for it is. "Know thyself," and then, acknowledging the infinite possibility that is yours, the stern responsibility that is yours, and yours alone, go forth in humble faith, but firm resolve, on, on into the unknown, believing that "Man is his own star, our acts our angels are, for good or ill."

Think! Think in the quiet of your lonely lodging; think at this milestone of Time. Get out of yourself for once, out and above all the miserable medley of little illusions which is ever falling around to shut out the stern realities of life, and think seriously, soberly, not solely on the little I can put before you of this great matter of life—your life; but lift yourself godlike far beyond all that words of mine could express. Fight! Fight it out with the enemy, that's yourself; then act. Let noble thought beget prompt action. Things do not seem quite as they should in the gardening world. Many in Bothydom feel that it is so, and more feel it later on. Most thinking lads are unable to view the outlook with unqualified satisfaction; some few are wholly dissatisfied with it, but fewer still dissatisfied with themselves. To the last and most limited section my heart goes out. Amongst them are the men of the future, and I venture to predict, as I honestly believe, that they can, if they choose, become almost anything they like. If they don't it is because they either do not choose or are ignorant of their inherent power.

To those who have adopted gardening from an unbiassed choice there is little to say. To those who have been forced into it, as many are, happy will they be if their chance profession becomes the profession of their choice. There are, of course, drones, and ever will be in the great industrial hive; no spurring from me, or anyone else, can urge them to flights in the higher life, or do more than get them to emit a buzz of discontent. Far be it from me to disturb their somnolent equanimity; nor, indeed, am I likely to. Yet they are useful in a way, and have their own niche in the great temple of universal economy. It is those who have more or less of the good old gardening grit in them I would press on to bring inspiration into their lives and work that this year, of all years, may for them be a very happy one, some day happier still if in looking back it has marked for them a turning point in the march of Time.

Again. Think, I ask you! Have a little quiet thought on a matter of such immense concern to yourself. Jot those thoughts down with the resolve that comes spontaneously with them. Then, "to be, or not to be," that is the question, and the question for you alone. *Tu es custos.* Endorse the audit January, 1903, and in a year from date look over it, look into it, and again mark time. God speed you on your journey. May you go from strength to strength till you cross the bar into the soul's great ocean of eternity:

Too full for sound and foam,  
When that which draws from out the boundless deep  
Again turns home.

—A. N. OLDHEAD.

### Hardy Fruit Garden.

**PRUNING FAN-TRAINED FRUIT TREES.**—When trained in this manner on walls, some trees, such as Plums, Morello Cherries, Apricots, Peaches, and Nectarines, bear annually profitable crops. The principle carried out with this style of training is not to allow the furnishing of the wall to be taken up with a large number of permanent branches, these being clothed with spurs more or less long, and thickly placed. There must be a certain number of main branches, but these have been originated at an early date in the tree's existence, and are necessary for the proper furnishing of the wall as well as a foundation from which the bearing branches may spring. They are, or should be, arranged at equal distances apart, so as to give an equally balanced tree. From these, young branches or growths may be trained to cover the rest of the space. In the case of Morello Cherries, the wall space may be freely covered with young growths of the current year, secured about 3 in apart. These growths must be reserved in summer, during which time there is some difficulty in finding room for them; but after the crop has been gathered, the shoots which have borne the crop are cut out, and those reserved trained in. The same method of procedure is followed with Apricots, Peaches, and Nectarines, though young shoots are not quite so freely laid in nor so close together. One great advantage of fan-training is that it is quite easy to rearrange the branches when there are vacant spaces requiring to be filled. In pruning now, cut out all the superfluous wood, whether it be old bearing wood or growths exhausted by age, first. Next, as there are usually more shoots than room can be found for, a judicious selection must be made of those suitable for training in and are well placed for the purpose. Morello Cherries and Plums may be pruned now, leaving Apricots, Peaches, and Nectarines for a few weeks longer.

**SMALL BUSH FRUITS.**—The pruning of Gooseberries, Currants, and Raspberries may be carried out now, though it is often usual to defer the pruning of the former until early spring. There is, however, no reason why, if more convenient, the pruning should not be done at the present time, especially if the branches can be dusted over with soot or lime as a means of repelling birds which destroy the buds.

**BUSH GOOSEBERRIES** ought to have sufficient room between them, so that it is not difficult to get round for all purposes. A good thinning out of unsuitable growths and branches should first take place, dealing with those at the base and descending to the ground, also the crowded centres. Follow this by a general reduction of the other shoots. The system of shortening or spurring back growths is not to be recommended. Young, well-ripened growths will bear freely, and the object in pruning must be to leave a fair number of these, and if they have unripe buds such may be cut back to well-ripened wood.

**BUSH RED AND WHITE CURRANTS** can only be profitably treated by one method of pruning, and that is purely the formal or cordon style. Bushes may usually have five or seven main branches. The side growths on these must be pruned back to within an inch, and the leading growths the same, unless further extension is necessary. Sometimes it will be essential to encourage fresh growths from the base to take the place of worn-out branches. These growths should be slightly shortened each year, so that the production of side growths may be encouraged.

**BLACK CURRANT BUSHES** are treated in pruning on the simple plan of cutting out the old wood and retaining vigorous young shoots for bearing, not shortening these at all. They will bear profitable crops, the berries and bunches being finer than any produced on older wood.

**RASPBERRIES** offer but little difficulty in the matter of pruning. The canes which have borne fruit during the past season are dead and useless, and should be cut down close to the ground, leaving plenty of space for the new canes, which are very strong and vigorous. When numerous, make a selection of the best, and limit the number to half a dozen to each stool, or, if in lines, sufficient to train in 6 in or 8 in apart on the trellis or wires. Suckers issuing at a distance should be dug up.

**BLACKBERRIES AND LOGANBERRIES.**—Both produce long growths during the season, which require to be well ripened, shortened slightly, and trained in on a trellis, or on wires, to fruit, securing the growths more or less horizontally. They will succeed trained in upright form, or round stakes placed in triangular fashion.

**JAPANESE WINEBERRY.**—Similar treatment to that accorded for Raspberries is admirably adapted for this fruit. The fruit is borne on the strong, fully-ripened suckers the year following their production, hence after fruiting prune away these old growths entirely to make room for the new. It is important that the growths should have had every opportunity to ripen well.—E. D. S.

### Fruit Forcing.

**PEACHES AND NECTARINES: EARLY FORCED HOUSE.**—The buds of trees started in former years during December are swelling freely and showing colour, so syringing over the trees should cease, as the water often causes the flowers to damp. Maintain, however, a genial condition of the atmosphere by sprinkling the floor and border with water in the morning and afternoon of fine days. Provide a little ventilation constantly at the top of the house. Raise the heat early in the day to 50deg, and not exceeding 55deg from fire heat, and admit a little air, yet not so as to lower the temperature below 50deg. Increase the ventilation with the sun heat, having it full at 65deg, and gradually reduce it with the declining temperature, closing (subject to a small amount of air being left on) for the day at 55deg. On cold nights the minimum temperature should be maintained at 40deg to 45deg; between the latter and 50deg is ample on mild nights. Nothing is gained (but the prospect of a crop may be lost) by undue haste until the days have turned, and there is an increase of light and length of day. Nevertheless, aim at steady progress, allowing the trees abundance of air, and a genial warmth by day, with rest at night.

**SECOND EARLY HOUSE.**—The very early Peaches, Alexander and Waterloo, have not proved satisfactory varieties in many places for early forcing, through casting the buds, though when the trees are grown as standards and pinched, the buds are retained on the latest made wood, and the bearing is satisfactory. Early Louise is generally too poor in colour to please either at table or for marketing purposes. Hale's Early is everything desirable as regards size (being medium), colour, and quality, but the tree has the bud-dropping defect in less degree only than marked in Alexander and such varieties as Early York. Of all varieties, Royal George holds its buds the best, and for general purposes the best of all Peaches for forcing. Stirling Castle, of the Royal George type, however, is quite as much in favour as Royal George in some localities, especially northern, for early forcing, and, though somewhat smaller, has good colour and excellent quality. Dymond, a fine, large, highly coloured fruit, ripens about the same time as Royal George, and is first-rate in quality. In Nectarines, Cardinal is, perhaps, unrivalled as a first early, and Early Rivers comes next, for Lord Napier has a bad fault of shrivelling at the apex, and this detracts from the appearance of the fruit, though not its quality, which is excellent. Elruge is the usual companion for Royal George Peach, and is unsurpassed; for, though Stanwick Elruge is larger and ripens a little earlier, it has a bad habit of dropping its fruit when commencing ripening. All these things tell in marketing returns. If the house has been open to receive the autumn rains, the border will be thoroughly moist to the drainage. If, on the other hand, the lights have not been removed, there may be need for repeated waterings to bring the soil into a moist, but not sodden, condition, as is often the case by dosing with liquid manure at the time of starting or just before. Judicious applications of liquid manure help them immensely, and where the drainage is efficient, there is little danger of the soil getting sodden by the rainfall or applications of water. Fire heat will only be necessary at the commencement to prevent the temperature falling below freezing point at night, and to maintain 50deg in the daytime, admitting air freely at and above that heat.

**SUCCESSION HOUSES.**—The cleansing of the house and trees should be pushed forward, and brought to a close as soon as possible. Where the trees have been infested with brown aphid, red spider, or scale, it is desirable to syringe the whole house with hot water at a temperature of 140deg, which will soften the dirt and destroy all the insects it reaches. The woodwork should then be thoroughly cleaned with carbolic or paraffin soap and water, using a brush, and the glass inside and outside with clear water. The trees should then be dressed with an insecticide, those advertised being handy and effective, adhering to the instructions. Or dissolve 1½lb of soft soap in a gallon of soft water by boiling, and on removing from the fire add half a pint of paraffin oil, and stir briskly, so as to thoroughly amalgamate the oil with the soapy solution. For use dilute to six and a quarter gallons with hot water, and apply at a temperature of 130deg to 140deg, either by spraying or application with a brush, the latter being the most effectual when done thoroughly, and care taken not to dislocate the buds. Prior to this the trees will have been pruned, and after dressing the branches can be re-arranged, and the growths trained to the trellis. The walls should be limewashed. Re-

move the loose surface soil, add fresh lumpy loam with a fourth of well-decayed manure, and supply a handful of some approved fertiliser per square yard. Dissolved bones, dry and crumbling, five parts, sulphate of potash three parts, sulphate of ammonia one part, and ground gypsum two parts (mixed) may be used. If the soil be rich and inclined to dampness or soapiness, apply basic slag phosphate at the rate of 1½lb per square yard, and point in without disturbing the roots. In the case of the other mixture a light scratching with a rake or fork will suffice, and the rain or watering will work the ingredients into the soil. If the roof lights are fixed ventilation should be given fully, the trees being afforded as much rest as possible, care being taken not to allow them to become dry at the roots. If the roof lights are movable, and have been removed, they may remain off until the time arrives for starting the trees, or until the buds commence swelling, when the lights must of necessity be replaced to insure the safety of the buds and blossoms.

**UNHEATED HOUSES.**—These structures are often made receptacles for other plants, and the welfare of the trees is more or less interfered with. The better plan is to remove the roof lights and let the trees and soil have the benefit of the exposure. The trees will not take the least harm, no matter how severe the weather may be, provided the wood be well ripened; but if there is any doubt about that, the lights are best retained over the trees, as frost acting on such whilst wet may cause their destruction. In the latter case, and also when the lights are removed, pruning may be deferred until the buds commence swelling, or, preferably, proceed with it, cleansing the house and trees as opportunity offers, and as detailed for succession houses. If the trees are disposed to make long-jointed wood, it is advisable to avoid nitrogenous manures, especially those of a quick acting nature, as nitrate of soda and sulphate of ammonia, also potassic, such as muriate of potash, supplying bonemeal or basic cinder phosphate, which furnishes phosphoric acid and lime. Potash, if given at all, should be in the form that will hinder its softening tendency, such as refined kainit (double sulphate of potash and magnesia), using about equal parts of it and basic slag phosphate, supplying 4oz of the mixture per square yard, pointing in lightly. On the other hand, where trees make too little wood, and are more prolific of fruit than desirable for attaining a first-class size, the border may be dressed with a combined phosphatic and nitrogenic manure, say, dissolved bones two parts, nitrate of potash one part, using 4oz per square yard. If a limy soil, use steamed bonemeal three and a half parts, muriate of potash one and a half part, and nitrate of soda one and a half part, applying 4oz of the mixture per square yard. The mixture should be given when the trees commence swelling the buds, washing in moderately, repeating when stoning is completed. These elements mainly benefit the trees in the year of application, therefore they must be applied when they can be appropriated and transformed into imbibable form. This is when the trees are in growth, and to benefit the fruits the manure must be available whilst they are swelling. Carefully examine inside borders, and supply a thorough watering if dry, or lack of moisture at the roots will cause the buds to fall later on. Keep the houses as cool as possible, so as to insure complete rest.—ST. ALBANS.

### LARGE-FLOWERED CLEMATIS FOR SPRING.

Every nurseryman and every florist knows of the loss of plants of Clematis, both by themselves and their customers. This loss is more likely to occur when the creepers are set in the fall than when done in spring, having in mind the large-flowered sorts principally. These are largely grafted on the *C. flammula*, and the fleshy roots of this stock do not take kindly to fall transplanting. Just why this is I cannot say, and it may not be so generally; but it has been my experience that to set out the plants in the fall is almost equivalent to throwing them away. That the cold soil has something to do with it is believed, because, when potted and placed in a greenhouse, the result is different. Magnolias and Tulip Poplars behave in a similar way, and they have fleshy roots. Transplant them in autumn, and they die for sure; set in spring, they grow. Careless planters cause the death of many Clematis by not spreading out the roots. They set them in a bunch, as if the cluster was one root, resulting in the inner ones getting not a particle of soil to touch them. These roots rot, and the whole mass becomes diseased. The roots should be well spread out, so that each is encased in soil. Sand is good to use to cover them with, as it works in well around the roots. Many trees, evergreens, such as Hemlock and Arbor Vitæ, especially, are often destroyed in the same way. They have large clusters of small roots, mat-like in appearance, and it needs great care to have the soil reach everyone.—J. MEEHAN (in the "Florists' Exchange.")

\* \* All correspondence relating to editorial matters should be directed to "THE EDITOR," 12, Mitre Court Chambers, Fleet Street, London, E.C. It is requested that no one will write privately to any of our correspondents, seeking information on matters discussed in this Journal, as doing so subjects them to unjustifiable trouble and expense.

**BOTHY PLAN COMPETITION.**—A number of plans have been received.

**PEARS NOT RIPENING (A. L.).**—Many Pears fail to ripen because they are gathered too soon, and then stood in a very light dry place, whereby their juices escape and the fruit becomes dry and remains firm. As you give us no particulars to guide us in forming a judgment in your individual case, we are only able to give this general reply. We did not publish the report to which you refer, because it was a distinct and most effective advertisement of the products of a firm who do not advertise in our pages. We do not, however, suppose for a moment that you were animated with other than a worthy motive in sending the report.

**WIREWORM AND GRUBS IN A GARDEN (Irish Subscriber).**—If wood is plentiful in your district, and can be had at little beyond the cost of cutting, the best thing to do would be to make some fires, and when strong enough dig soil from around them and place on to be scorched. This would not only extirpate the grubs, but would be of greater benefit to the soil than a heavy dressing of manure. Failing your ability to act as suggested, we should use gas lime, fresh and strong, at the rate of half a ton to the acre, carefully digging it in and mixing it with the soil, not merely burying it in layers in the trenches formed in digging. This may be done now, and the sooner the better with land that is quite vacant, but not half that quantity must be applied to land that is cropped or within three months of sowing or planting. Either in addition to that dressing or independently of it ordinary fresh slaked lime may be pointed into the soil in spring, shortly before sowing or planting, at the rate of fifty bushels per acre, and twice that quantity would do no harm if the land is strong or very rich.

**PRUNING GOOSEBERRIES (Pershore).**—Whinham's Industry Gooseberry has been illustrated in this Journal, and testimony published of its productiveness. You are not likely to spoil your newly planted trees by rather close pruning, provided you cut to prominent buds on the young wood, or that formed last year, selecting those buds that point in the direction you wish future growths to extend. First thin out the growths if numerous, making cuttings of those removed, and leaving those retained 6in asunder. These may be shortened to 3in or 4in, the parts removed, if long enough, being inserted as cuttings. When a choice is afforded, we prefer cuttings 15in to 18in long, but have inserted them less than a third of that length, or two joints within the soil, and one or two above it, the buds being removed from the portion inserted if suckers were not desired for future cuttings. The cuttings should be inserted firmly in sandy soil. The leading growths of established Gooseberry bushes may be left longer than above indicated, and side growths from the main branches may be shortened to within an inch of the base of the young wood both on newly planted and established trees.

**PRUNING FRUIT TREES (W. A. K.).**—The condition of the roots is an important factor in determining the extent to which the branches of recently planted trees should be shortened. The more plentiful the roots are, especially those of a fibrous nature, the longer the branches may be left, and the more sparse the roots the closer should be the pruning of the shoots. See our reply to "W. J." on pruning and planting Apricot trees. You will perhaps not err by removing about one-fourth the length of the branches of your trained Plum and Cherry trees, but the roots must be your guide. The pyramid trees should be thinned out if the growths are numerous, the main branches being from 9in to a foot apart, any side growths on them shortened to about two buds, the terminals being left 8in or 9in long, according to their strength and the symmetry of the trees. Stone fruits are best attended to by disbudding and pinching the growths in summer so as to reduce the necessity of winter pruning to a minimum. Morello Cherries when established require scarcely any pruning in the winter, as the wood if trained thinly in the summer in order to become matured bears throughout its length like that of Peaches. It is often advisable, however, to both thin out and shorten the shoots of newly planted trees to insure a good growth the first season, then disbudding to prevent over-

crowding is the most important point in management. The "Garden Manual," published at this office, price 1s. 6d., post free 1s. 9d., contains practical instructions on the management of trees.

**ADDRESSES (A. C.).**—We think you can obtain the information on meteorological instruments you require by writing to Messrs. Negretti and Zambra, Holborn Viaduct, London.

**BOOK WANTED (A. B. C.).**—We know of no book at present in print on the subject of table decorations. Such a book would find a ready demand, and we suggest that some lady or gentleman might compile one.

**GHEENT QUINQUENNIAL EXHIBITION (J. S. Brunton).**—Our brief report of this exhibition, in 1898, appeared in the issue for April 21 of that year, pages 350 and 351. Our publisher charges 1s. 4d. per copy for a number so far back, which, moreover, may not be in stock.

**EUCHARIS ROOTS DESTROYED (J. F. G.).**—The bulbs are attacked by the destructive mite that is not by any means easy to eradicate, still we have seen bulbs quite as much injured as those you have sent that were cleansed, and afterwards rooted freely, healthy plants resulting, and now producing flowers. Remove all the injured roots and scaly matter from both the base and neck of the bulbs, then wash them thoroughly in a solution made by dissolving 2oz of softsoap with a lump of soda as large as a nutmeg in a gallon of soft boiling water, stirring in briskly while still hot a small wineglassful of common petroleum, such as is burned in lamps. When this has cooled somewhat, but is still as hot as the hand can be borne in it for a moment or two, dip the bulbs in it and rub the solution into every fissure with a soft brush. This mixture will destroy all the mites that are reached. Place the bulbs in small, clean, well-drained pots of rather sandy turfy loam, embedding them in and surrounding with crushed charcoal, plunging the pots in bottom heat if convenient; then, if the soil is kept moderately moist, but not distinctly wet, fresh roots will in all probability be emitted. A little soot and bruised charcoal mixed with the turf used will be an advantage, as much as would fill a dessert spoon being sufficient of the former for a 5in pot; charcoal may be safely used more freely.

**PLANTING AND PRUNING APRICOT TREE (W. J.).**—We presume your tree is young. If it is well rooted—that is, has a good number of fibrous roots, we should not shorten the branches to any great extent. In planting, cut off all jagged roots and bruised portions and plant in a mixture of fresh loam, lime rubbish, and wood ashes, laying the roots out straight, separating them, and packing the soil rather firmly round them, covering about 5in deep and spreading littery manure over the surface and for a foot or more beyond the extension of the roots. If the branches are numerous remove some of the weaker entirely, so that the others can be disposed 8in or 9in apart, and if there is a foot between them at a distance of 3ft from the stem all the better. Assuming roots are plentiful, we should only remove the unripe ends of the branches, say a length of 6in, more or less according to their condition and with due regard to the symmetry of the tree, cutting from below and starting the undercut above what is to be the terminal bud, not below it, bringing the knife out above, as is frequently done. The lower branches of a tree should, as far as possible, be in advance—that is, longer than those above them, so that the lower part of the wall may be furnished. There is no difficulty in covering the upper portion. When a branch is disposed to lag behind, it should be trained more or less towards a vertical position, those fully too strong being correspondingly depressed. When luxuriant shoots push from the centre of the tree and threaten to draw the sap from the weaker growths below, the tips may be taken from the strong shoots when 6in long, and the secondary growths that will push will quite equal in strength the first growths on the lower branches. Apricots trained thinly and a good balance of growths maintained in summer, the roots encouraged to extend in rather firm and not over-rich soil near the surface, produce short-jointed wood that matures and becomes fruitful in character, and no more shortening of the branches is then required in the winter than may be advisable for forming a well-balanced, fruitful tree. Do not secure the branches tightly to the wall on planting, as the soil may settle somewhat and drag the roots downwards if the branches are immovable. The Hemskerk is a variety of the Moorpark, and one of the most useful Apricots you can grow.

**NAMES OF FRUITS.**—Correspondents whose queries are unanswered in the present issue are respectfully requested to consult the following number. (A. B.).—1, King of the Pippins; 2, Nelson's Codlin; 3, American Mother; 4, Blenheim Orange; 5, same as No. 1; 6, Red Streak.

**NAMES OF PLANTS.**—Correspondents whose queries are unanswered in the present issue are respectfully requested to consult the following number. (L. F.).—1, Tibouchina macrantha; 2, Polygala oppositifolia. (H. J.).—Mesembryanthemum sp. (T. P.).—1, Dendrobium aureum; 2, Cypripedium Curtisi. (T. L. F.).—1, Azara microphylla; 2, Berberis asiatica; 3, Jasminum nudiflorum; 4, Begonia manicata variegata.

## Land Drainage.

As this topic is one which annually crops up during the winter season, a few special words in connection with it may not be out of place. England is, in itself, rather a flat country, and although we see on the map ranges of hills, they are, as a rule, of slight elevation, and the lower reaches of the rivers are almost at a dead level. Very little of this low lying land is now out of cultivation, for enterprise in drainage works has converted much of it into fertile, and therefore valuable fields; but although much has been done by landlords and drainage commissioners in cutting main drains and keeping open the natural fall of watercourses and rivers, yet much depends upon the advantage which a tenant may take of the draining opportunities which lie at his elbow. There are many ways of laying drains, and it is easy to find any but the best, and it is to suggest the latter that we are now writing.

Experts on drainage matters vary as to the depth at which drains should be laid, but there should be no hard and fast rule. We will lay down as the first axiom: That no under draining should commence more than fifteen chains from the outfall, i.e., from the open drain into which the under drain falls. Fifteen chains is really a very long length, and ten chains should be the limit. Water will not flow readily without sufficient vent, and the longer the length the greater is the difficulty in this respect. Every field should be drained by itself, i.e., have its own drainage system independently of the next.

The drainage of each field should be somewhat of the nature of the branches of a tree, or of two or three trees, the branches carrying the water to the main stem, or stems, and through them to the open drains or outfalls. For drains to fully carry out their proper functions, however, they must have an air supply at the upper end, and we apprehend that it is the want of this which makes so many drains work so badly. The more sodden the land, and the more necessary the drainage, the greater the vacuum caused by the absence of vent at the upper end; therefore we would urge all persons who have drainage of the land to contend with—and when we use the word contend we mean that no one would willingly undertake for amusement—to make the best use of their outfall, and by so doing to bring the upper portions of the drains in each field as near the surface as is compatible with good and sufficient cultivation.

If the land be fairly well drained to a depth of 20in, few useful plants will refuse to grow in it, and even in very stiff soil water will find its way to a shallow drain which has an upper vent, and we are therefore strongly in favour of carrying the upper end of land drains right up to the boundary of the field, and to an open ditch, if there is one. A syphon is excellent when it is started, but what of it when the suction is the wrong way? As we have already stated, all drains should be as short as conveniently may be, and the system of drainage of each field arranged in the simplest manner. In the case of a long, narrow field, with a main open drain at its lower end and a subsidiary drain running down one side of it, the drainage should consist of a number of small drains running across the field in a slanting direction to the side drain. The water is much more quickly brought into the open, and the drains, being short, run much more freely than they would if they were under ground the whole length of the field.

In laying field drains it is most necessary to keep the fall even and regular, and as there is much less difficulty in doing this in the case of short lengths, this is an additional argument in favour of independent cross drainage. But be the drains long or short, the ground should first be thoroughly surveyed, and levels taken, so that the exact amount of fall may be known. If stakes are driven into the ground at about two-chain intervals, so that the tops of all the stakes are at one uniform height above the pro-

posed drain, the workmen can hardly get far wrong. To get the pipes laid quite evenly a long and stiff lath may be used.

There is no need to dig much wider than the width of the pipes to be buried, in the case of shallow drains; but deep ones entail the removal of a quantity of soil at great expense, and it is often quite unnecessary. It is not a good plan to take advice from men who are likely to have the work to do, for if work be slack at the time they may urge an unnecessarily expensive scheme in their own interest.

When filling in after the pipes are laid, fine soil should never be put in first. In the case of grass land the top sod may be put in grass downwards, but thorns or hedge brushings are still better, as they act as conductors of the water to the crevices between the pipes, and prevent these joints from becoming closed up. In the case of arable, and especially strong land, something of this kind to lie above the pipes is almost a necessity if the greatest benefit is to be obtained, or, in some cases, any benefit at all.

As regards the pipes or tiles to use, there is much difference of opinion. Although the 4in pipe, with its flat bottom and round arch—but, of course, entirely round inside—is now almost universally used, we still have a liking for the old-fashioned tile, like an inverted U, which stood upon a separate flat tile, forming the bottom. These were not readily laid, but they had to be laid carefully, and that often prevented scamped work. The flat bottom rendered them rather more liable to silt up, but they had an attraction for water and made a most effective drain. In the words of an old drainer, "They could utter a lot o' watter."

## Work on the Home Farm.

We have had a mild week and much drier weather, and at last have the gratification of seeing a goodly acreage of Swedes in heaps and covered with soil. The crop is most satisfactory, and the men are inclined to grumble at the price (9s. per acre). Perhaps they have a right to a growl sometimes. Of course, they do not take the infection from their employers!!!

We have got the steam cultivators at work at last, and as the owner is full of orders and most anxious to press on with his work, we hope the work will soon be done. The work—ploughing seeds for Potatoes—must be properly done, and the depth of 10in maintained throughout, so we have to keep a strict look-out, for it is surprising what a difference is made to the pace of the plough by 2in of depth. If the man on the plough has a monetary interest in getting the work done quickly, a man will be needed to watch how the work is done and report failures.

The horses are occupied in ploughing Turnip land, which has dried nicely this week, and turns over satisfactorily. There are also a good many Turnips to cart for the cattle in the yards. The roots are rather a long way off to lead home, but we have plenty of them and they are very good meat, ripe and sound. So we shall use them freely, and save straw and hay as much as possible.

With plenty of roots to pulp, dried grains are a most useful form of purchased food, especially for growing stock. They provide the proportion of albuminoids which root crops lack, and the addition of a small quantity of sharps or barley meal would complete an excellent ration. Straw is fairly plentiful this year, but much of it is weathered, and with plenty of Turnips we should reduce the use of cut straw where possible. Treacle in moderate quantity is an excellent addition to a feeding ration, but its extended use largely depends on the chaff or cut straw supply, for it must be well diluted with water, and then requires a large bulk of chaff as a medium to be consumed with.

We have had a sale of Turnips in the parish, and there were no bids. No further comment is needed as regards the Turnip crop. As a consequence, all cattle and sheep are dear. Although meat is scarce and commands a good price, store cattle and sheep cannot be bought to pay. Newspaper quotations of the pig markets vary very widely. Pork is dear enough here. We know that 8s. per 14lb has been given by weight. Young heifers should be put to the bull now and they will calve down when they are most wanted. If you start them breeding in autumn it is not difficult to keep them to it.

## Gardeners' Provident and Charitable Institutions.

THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.—*Secretary*, Mr. G. J. Ingram, 175, Victoria Street, S.W.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT SOCIETY.—*Secretary*, Mr. W. Collins, 9, Martindale Road, Balham, London, S.W.

ROYAL GARDENERS' ORPHAN FUND.—*Secretary*, Mr. Brian Wynne, 2, Danes Inn Strand, London, W.C.
